

TMS320F2806x Piccolo™ Microcontrollers

1 Device Overview

1.1 Features

- High-Efficiency 32-Bit CPU (TMS320C28x)
 - 90 MHz (11.11-ns Cycle Time)
 - 16 x 16 and 32 x 32 Multiply and Accumulate (MAC) Operations
 - 16 x 16 Dual MAC
 - Harvard Bus Architecture
 - Atomic Operations
 - Fast Interrupt Response and Processing
 - Unified Memory Programming Model
 - Code-Efficient (in C/C++ and Assembly)
- Floating-Point Unit (FPU)
 - Native Single-Precision Floating-Point Operations
- Programmable Control Law Accelerator (CLA)
 - 32-Bit Floating-Point Math Accelerator
 - Executes Code Independently of the Main CPU
- Viterbi, Complex Math, CRC Unit (VCU)
 - Extends C28x Instruction Set to Support Complex Multiply, Viterbi Operations, and Cyclic Redundancy Check (CRC)
- Embedded Memory
 - Up to 256KB of Flash
 - Up to 100KB of RAM
 - 2KB of One-Time Programmable (OTP) ROM
- 6-Channel Direct Memory Access (DMA)
- Low Device and System Cost
 - Single 3.3-V Supply
 - No Power Sequencing Requirement
 - Integrated Power-on Reset and Brown-out Reset
 - Low-Power Operating Modes
 - No Analog Support Pin
- Endianness: Little Endian
- JTAG Boundary Scan Support
 - IEEE Standard 1149.1-1990 Standard Test Access Port and Boundary Scan Architecture
- Clocking
 - Two Internal Zero-Pin Oscillators
 - On-Chip Crystal Oscillator/External Clock Input
 - Watchdog Timer Module
 - Missing Clock Detection Circuitry
- Peripheral Interrupt Expansion (PIE) Block That Supports All Peripheral Interrupts
 - Three 32-Bit CPU Timers
 - Advanced Control Peripherals
 - Up to 8 Enhanced Pulse-Width Modulator (ePWM) Modules
 - 16 PWM Channels Total (8 HRPWM-Capable)
 - Independent 16-Bit Timer in Each Module
 - Three Input Enhanced Capture (eCAP) Modules
 - Up to 4 High-Resolution Capture (HRCAP) Modules
 - Up to 2 Enhanced Quadrature Encoder Pulse (eQEP) Modules
 - 12-Bit Analog-to-Digital Converter (ADC), Dual Sample-and-Hold (S/H)
 - Up to 3.46 MSPS
 - Up to 16 Channels
 - On-Chip Temperature Sensor
 - 128-Bit Security Key and Lock
 - Protects Secure Memory Blocks
 - Prevents Reverse-Engineering of Firmware
 - Serial Port Peripherals
 - Two Serial Communications Interface (SCI) [UART] Modules
 - Two Serial Peripheral Interface (SPI) Modules
 - One Inter-Integrated-Circuit (I²C) Bus
 - One Multichannel Buffered Serial Port (McBSP) Bus
 - One Enhanced Controller Area Network (eCAN)
 - Universal Serial Bus (USB) 2.0 (see Device Comparison Table for Availability)
 - Full-Speed Device Mode
 - Full-Speed or Low-Speed Host Mode
 - Up to 54 Individually Programmable, Multiplexed General-Purpose Input/Output (GPIO) Pins With Input Filtering
 - Advanced Emulation Features
 - Analysis and Breakpoint Functions
 - Real-Time Debug Through Hardware
 - 2806x Packages
 - 80-Pin PFP and 100-Pin PZP PowerPAD™ Thermally Enhanced Thin Quad Flatpacks (HTQFPs)
 - 80-Pin PN and 100-Pin PZ Low-Profile Quad Flatpacks (LQFPs)

1.2 Applications

- Switch Mode Power Supplies (SMPSs)
- Solar Micro Inverters and Converters
- Power Factor Correction (PFC)
- Smart Grid and Power Line Communications
- AC/DC Inverters

1.3 Description

The F2806x Piccolo™ family of microcontrollers (MCUs) provides the power of the C28x core and CLA coupled with highly integrated control peripherals in low pin-count devices. This family is code-compatible with previous C28x-based code, and also provides a high level of analog integration.

An internal voltage regulator allows for single-rail operation. Enhancements have been made to the High-Resolution Pulse Width Modulator (HRPWM) module to allow for dual-edge control (frequency modulation). Analog comparators with internal 10-bit references have been added and can be routed directly to control the ePWM outputs. The ADC converts from 0 to 3.3-V fixed full-scale range and supports ratio-metric V_{REFHI}/V_{REFLO} references. The ADC interface has been optimized for low overhead and latency.

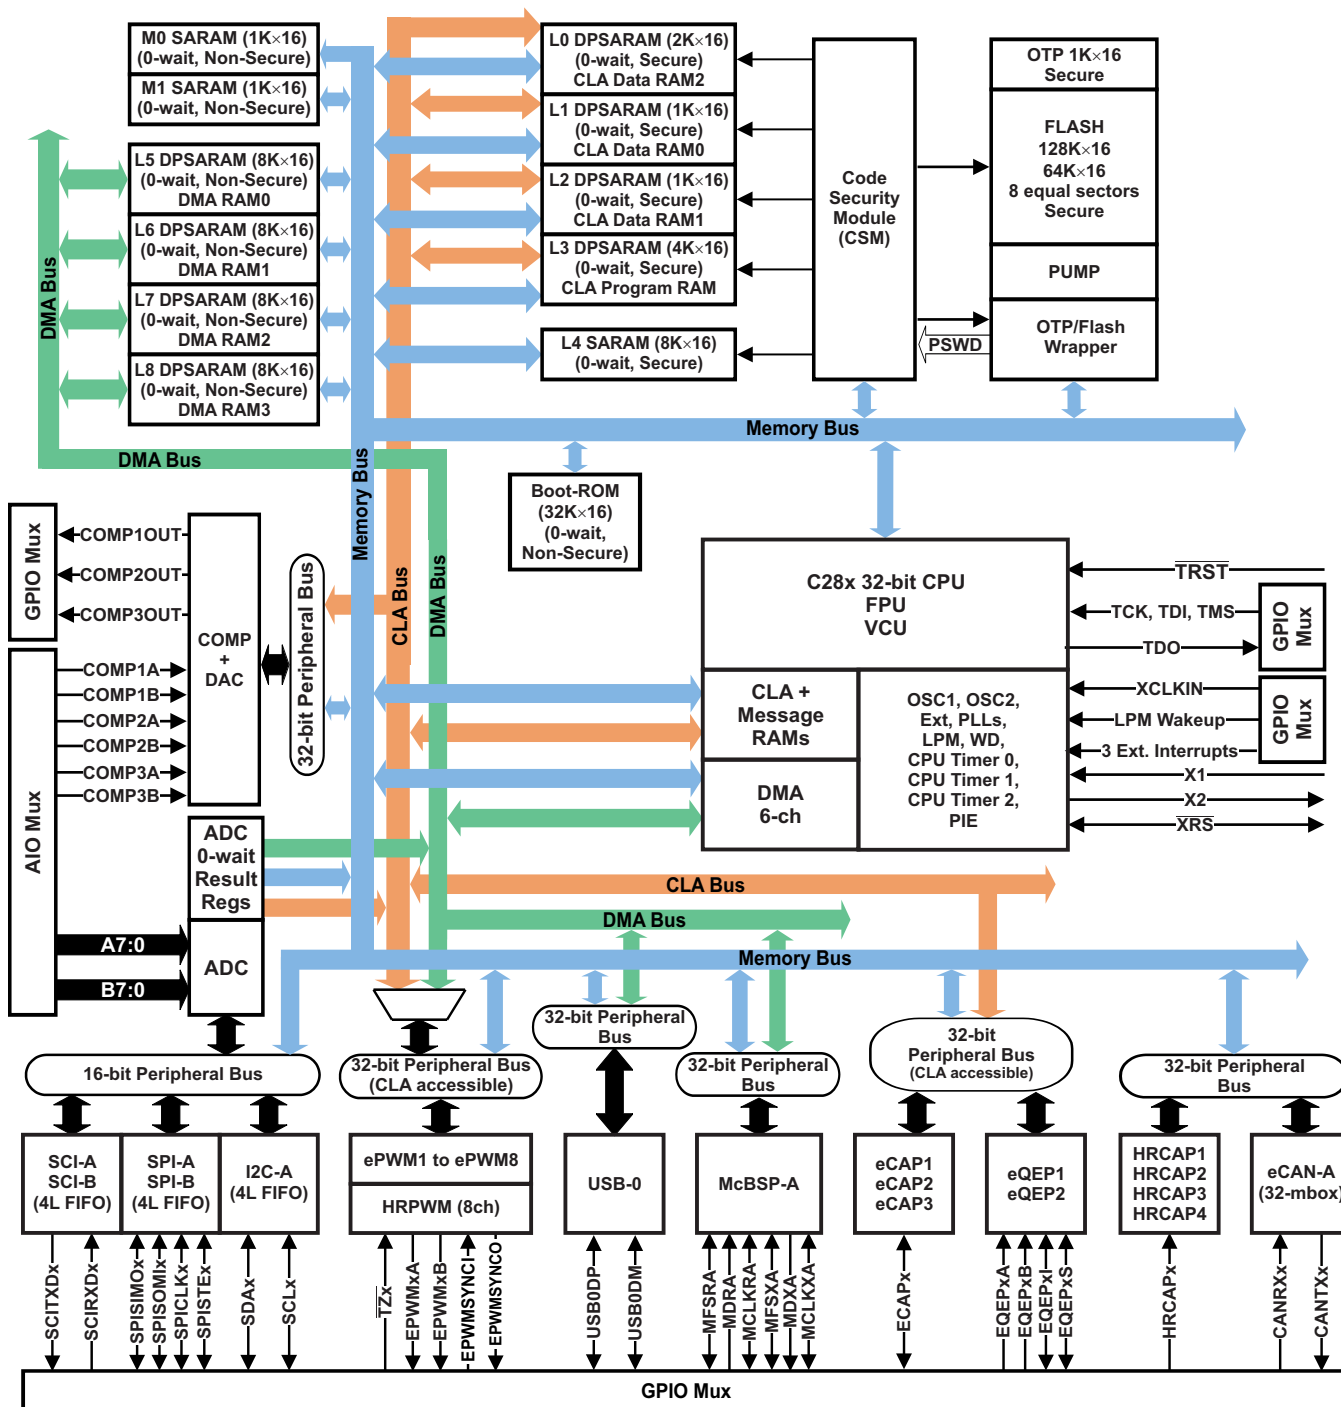

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
TMS320F28069PZP	HTQFP (100)	14.0 mm × 14.0 mm
TMS320F28069PFP	HTQFP (80)	12.0 mm × 12.0 mm
TMS320F28069PZ	LQFP (100)	14.0 mm × 14.0 mm
TMS320F28069PN	LQFP (80)	12.0 mm × 12.0 mm

(1) For more information on these devices, see [Section 9](#), Mechanical Packaging and Orderable Information.

1.4 Functional Block Diagram

Figure 1-1 shows a functional block diagram of the device.

A. Not all peripheral pins are available at the same time due to multiplexing.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from July 2, 2014 to March 22, 2016 (from E Revision (July 2014) to F Revision)	Page
• Global: Changed "CAN 2.0B" to "ISO11898-1 (CAN 2.0B)".	1
• Table 3-1 (Device Comparison): Changed the number of High-resolution ePWM Channels on the 80-Pin PN/PFP packages from 6 to 8.	7
• Table 3-1: Removed "Product status" row and associated footnote.	7
• Figure 4-1 (80-Pin PN and PFP Packages (Top View)): Added footnote about PowerPAD.	9
• Figure 4-2 (100-Pin PZ and PZP Packages (Top View)): Added footnote about PowerPAD.	10
• Section 4.2 (Signal Descriptions): Added "GPIO26–27" to NOTE.	11
• Table 4-1 (Signal Descriptions): Updated DESCRIPTION of X1, V_{REFHI} , V_{REFLO} , and V_{DDIO} .	11
• Section 5.1 (Absolute Maximum Ratings): Added Input voltage, V_{IN} (X1).	19
• Section 5.1: Added T_{stg} .	19
• Section 5.2 (ESD Ratings for TMS320F2806xU): Added section.	19
• Section 5.3 (ESD Ratings for TMS320F2806x, TMS320F2806xM, and TMS320F2806xF): Changed title from "Handling Ratings" to "ESD Ratings for TMS320F2806x, TMS320F2806xM, and TMS320F2806xF".	19
• Section 5.3: Updated footnotes.	19
• Section 5.4 (Recommended Operating Conditions): Removed footnote that read " V_{DDIO} and V_{DDA} should be maintained within approximately 0.3 V of each other".	20
• Section 5.6 (Power Consumption Summary): Changed section title from "Current Consumption" to "Power Consumption Summary".	21
• Section 5.12 (Power Sequencing): Updated paragraph that reads "There is no power sequencing requirement needed ...".	29
• Table 5-10 (XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)): Added MAX value for $t_{r(XCO)}$.	34
• Table 5-10: Added MAX value for $t_{r(XCO)}$.	34
• Table 5-15 (Flash/OTP Access Timing): Removed footnote.	36
• Figure 6-1 (28069 Memory Map): Added "FAST and SpinTAC Libraries" block. Changed size of Boot ROM.	48
• Figure 6-2 (28068 Memory Map): Added "FAST and SpinTAC Libraries" block. Changed size of Boot ROM.	49
• Figure 6-3 (28067 Memory Map): Added figure.	50
• Figure 6-8 (28062 Memory Map): Added "FAST and SpinTAC Libraries" block. Changed size of Boot ROM.	55
• Section 6.6.2 (Crystal Oscillator Option): Added paragraph that begins "The on-chip crystal oscillator X1 and X2 pins are 1.8-V level signals ...".	67
• Section 6.9.6.1.2 (McBSP as SPI Master or Slave Timing): Replaced "For all SPI slave modes ..." paragraphs with "For all SPI slave modes ..." table footnotes.	115
• Table 6-44 (McBSP as SPI Master or Slave Timing Requirements (CLKSTP = 10b, CLKXP = 0)): Added "For all SPI slave modes ..." footnote.	115
• Table 6-46 (McBSP as SPI Master or Slave Timing Requirements (CLKSTP = 11b, CLKXP = 0)): Added "For all SPI slave modes ..." footnote.	116
• Table 6-48 (McBSP as SPI Master or Slave Timing Requirements (CLKSTP = 10b, CLKXP = 1)): Added "For all SPI slave modes ..." footnote.	117
• Table 6-50 (McBSP as SPI Master or Slave Timing Requirements (CLKSTP = 11b, CLKXP = 1)): Added "For all SPI slave modes ..." footnote.	118
• Table 6-65 (HRCAP Registers): Added reference to footnote for HCICLR and HCIFRC.	137
• Section 7 (Applications, Implementation, and Layout): Added section.	156
• Section 8.1.1.1 (Getting Started): Updated links.	159
• Figure 8-1 (Device Nomenclature): Updated list of devices.	160
• Section 8.2 (Documentation Support): Added the <i>Calculating Useful Lifetimes of Embedded Processors Application Report</i> (SPRABX4) to list of application reports.	161
• Section 8.2.1 (Receiving Notification of Document Updates): Added section.	162

- (1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide (SPRU566)* and in the peripheral reference guides.
- (2) USB is present on TMS320F2806xU, TMS320F2806xM, and TMS320F2806xF devices.
- (3) The "Q" temperature option is **not** available on the TMS320F2806xU devices.
- (4) TMS320F2806xM devices are InstaSPIN-MOTION-enabled MCUs. TMS320F2806xF devices are InstaSPIN-FOC-enabled MCUs. For more information, see [Section 8.2](#) for a list of InstaSPIN Technical Reference Manuals.

(5) "Q" refers to Q100 qualification for automotive applications.

4 Terminal Configuration and Functions

4.1 Pin Diagrams

Figure 4-1 shows the pin assignments on the 80-pin PN and PFP packages. Figure 4-2 shows the pin assignments on the 100-pin PZ and PZP packages.

- Pin 19: V_{REFHI} and ADCINA0 share the same pin on the 80-pin PN and PFP devices and their use is mutually exclusive to one another.
Pin 21: V_{REFLO} is always connected to V_{SSA} on the 80-pin PN and PFP devices.
- The PowerPAD is not connected to the ground on the die. To facilitate effective heat dissipation, the PowerPAD must be connected to the ground plane of the PCB. It should not be left unconnected. For more details, see the *PowerPAD™ Thermally Enhanced Package Application Report (SLMA002)*.

Figure 4-1. 80-Pin PN and PFP Packages (Top View)

- A. The PowerPAD is not connected to the ground on the die. To facilitate effective heat dissipation, the PowerPAD must be connected to the ground plane of the PCB. It should not be left unconnected. For more details, see the *PowerPAD™ Thermally Enhanced Package Application Report (SLMA002)*.

Figure 4-2. 100-Pin PZ and PZP Packages (Top View)

4.2 Signal Descriptions

Table 4-1 describes the signals. With the exception of the JTAG pins, the GPIO function is the default at reset, unless otherwise mentioned. The peripheral signals that are listed under them are alternate functions. Some peripheral functions may not be available in all devices. See **Table 3-1** for details. Inputs are not 5-V tolerant. All GPIO pins are I/O/Z and have an internal pullup (PU), which can be selectively enabled or disabled on a per-pin basis. This feature only applies to the GPIO pins. The pullups on the PWM pins are not enabled at reset. The pullups on other GPIO pins are enabled upon reset. The AIO pins do not have an internal pullup.

NOTE

When the on-chip voltage regulator (VREG) is used, the GPIO19, GPIO26–27, and GPIO34–38 pins could glitch during power up. If this is unacceptable in an application, 1.8 V could be supplied externally. There is no power-sequencing requirement when using an external 1.8-V supply. However, if the 3.3-V transistors in the level-shifting output buffers of the I/O pins are powered before the 1.9-V transistors, it is possible for the output buffers to turn on, causing a glitch to occur on the pin during power up. To avoid this behavior, power the V_{DD} pins before or simultaneously with the V_{DDIO} pins, ensuring that the V_{DD} pins have reached 0.7 V before the V_{DDIO} pins reach 0.7 V.

Table 4-1. Signal Descriptions⁽¹⁾

PIN NAME	PIN NO.		I/O/Z	DESCRIPTION
	PZ PZP	PN PFP		
JTAG				
$\overline{\text{TRST}}$	12	10	I	JTAG test reset with internal pulldown (PD). $\overline{\text{TRST}}$, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. NOTE: $\overline{\text{TRST}}$ is an active-high test pin and must be maintained low at all times during normal device operation. An external pulldown resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k Ω resistor generally offers adequate protection. Because this is application-specific, TI recommends validating each target board for proper operation of the debugger and the application. (↓)
TCK	See GPIO38		I	See GPIO38. JTAG test clock with internal pullup. (↑)
TMS	See GPIO36		I	See GPIO36. JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. (↑)
TDI	See GPIO35		I	See GPIO35. JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. (↑)
TDO	See GPIO37		O/Z	See GPIO37. JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. (8-mA drive)
FLASH				
V_{DD3VFL}	46	37		3.3-V Flash Core Power Pin. This pin should be connected to 3.3 V at all times.
TEST2	45	36	I/O	Test Pin. Reserved for TI. Must be left unconnected.

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

PIN NAME	PIN NO.		I/O/Z	DESCRIPTION
	PZ PZP	PN PFP		
CLOCK				
XCLKOUT	See GPIO18		O/Z	See GPIO18. Output clock derived from SYSCLKOUT. XCLKOUT is either the same frequency, one-half the frequency, or one-fourth the frequency of SYSCLKOUT. This is controlled by bits 1:0 (XCLKOUTDIV) in the XCLK register. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting XCLKOUTDIV to 3. The mux control for GPIO18 must also be set to XCLKOUT for this signal to propagate to the pin.
XCLKIN	See GPIO19 and GPIO38		I	See GPIO19 and GPIO38. External oscillator input. Pin source for the clock is controlled by the XCLKINSEL bit in the XCLK register, GPIO38 is the default selection. This pin feeds a clock from an external 3.3-V oscillator. In this case, the X1 pin, if available, must be tied to GND and the on-chip crystal oscillator must be disabled through bit 14 in the CLKCTL register. If a crystal or resonator is used, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. NOTE: Designs that use the GPIO38/XCLKIN/TCK pin to supply an external clock for normal device operation may need to incorporate some hooks to disable this path during debug using the JTAG connector. This is to prevent contention with the TCK signal, which is active during JTAG debug sessions. The zero-pin internal oscillators may be used during this time to clock the device.
X1	60	48	I	On-chip 1.8-V crystal-oscillator input. To use this oscillator, a quartz crystal or a ceramic resonator must be connected across X1 and X2. In this case, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. If this pin is not used, it must be tied to GND.
X2	59	47	O	On-chip crystal-oscillator output. A quartz crystal or a ceramic resonator must be connected across X1 and X2. If X2 is not used, it must be left unconnected.
RESET				
$\overline{\text{XRS}}$	11	9	I/OD	Device Reset (in) and Watchdog Reset (out). Piccolo devices have a built-in power-on reset (POR) and brown-out reset (BOR) circuitry. During a power-on or brown-out condition, this pin is driven low by the device. An external circuit may also drive this pin to assert a device reset. This pin is <u>also</u> driven low by the MCU when a watchdog reset occurs. During watchdog reset, the XRS pin is driven low for the watchdog reset duration of 512 OSCCLK cycles. A resistor between 2.2 k Ω and 10 k Ω should be placed between XRS and V _{DDIO} . If a capacitor is placed between XRS and V _{SS} for noise filtering, it <u>should</u> be 100 nF or smaller. These values will allow the watchdog to properly drive the XRS pin to V _{OL} within 512 OSCCLK cycles when the watchdog reset is asserted. Regardless of the source, a device reset causes the device to terminate execution. The program counter points to the address contained at the location 0x3F FFC0. When reset is deactivated, execution begins at the location designated by the program counter. The output buffer of this pin is an open-drain with an internal pullup. (†)
ADC, COMPARATOR, ANALOG I/O				
ADCINA7	16	–	I	ADC Group A, Channel 7 input
ADCINA6			I	ADC Group A, Channel 6 input

AIO6			I/O	Digital AIO 6
ADCINA5	18	15	I	ADC Group A, Channel 5 input
ADCINA4			I	ADC Group A, Channel 4 input
COMP2A	19	16	I	Comparator Input 2A
AIO4			I/O	Digital AIO 4
ADCINA3	20	–	I	ADC Group A, Channel 3 input
ADCINA2			I	ADC Group A, Channel 2 input
COMP1A	21	17	I	Comparator Input 1A
AIO2			I/O	Digital AIO 2
ADCINA1	22	18	I	ADC Group A, Channel 1 input
ADCINA0	23	19	I	ADC Group A, Channel 0 input. NOTE: V _{REFHI} and ADCINA0 share the same pin on the 80-pin PN and PFP devices and their use is mutually exclusive to one another.

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

PIN NAME	PIN NO.		I/O/Z	DESCRIPTION
	PZ PZP	PN PFP		
V _{REFHI}	24	19		ADC External Reference High – only used when in ADC external reference mode. See Section 6.9.2.1 . NOTE: V _{REFHI} and ADCINA0 share the same pin on the 80-pin PN and PFP devices and their use is mutually exclusive to one another.
ADCINB7	35	–	I	ADC Group B, Channel 7 input
ADCINB6			I	ADC Group B, Channel 6 input
COMP3B	34	27	I	Comparator Input 3B
AIO14			I/O	Digital AIO 14
ADCINB5	33	26	I	ADC Group B, Channel 5 input
ADCINB4			I	ADC Group B, Channel 4 input
COMP2B	32	25	I	Comparator Input 2B
AIO12			I/O	Digital AIO12
ADCINB3	31	–	I	ADC Group B, Channel 3 input
ADCINB2			I	ADC Group B, Channel 2 input
COMP1B	30	24	I	Comparator Input 1B
AIO10			I/O	Digital AIO 10
ADCINB1	29	23	I	ADC Group B, Channel 1 input
ADCINB0	28	22	I	ADC Group B, Channel 0 input
V _{REFLO}	27	21		ADC External Reference Low. NOTE: V _{REFLO} is always connected to V _{SSA} on the 80-pin PN and PFP devices.
CPU AND I/O POWER				
V _{DDA}	25	20		Analog Power Pin. Tie with a 2.2-μF capacitor (typical) close to the pin.
V _{SSA}	26	21		Analog Ground Pin. NOTE: V _{REFLO} is always connected to V _{SSA} on the 80-pin PN and PFP devices.
V _{DD}	3	2		CPU and Logic Digital Power Pins. When using internal VREG, place one 1.2-μF capacitor between each V _{DD} pin and ground. Higher value capacitors may be used.
	14	12		
	37	29		
	63	51		
	81	65		
	91	72		
V _{DDIO}	5	4		Digital I/O and Flash Power Pin. Single supply source when VREG is enabled. Place a 2.2-μF decoupling capacitor on each pin. The exact value of the total decoupling capacitance should be determined by the system voltage regulation solution.
	13	11		
	38	30		
	61	49		
	79	63		
	93	74		
V _{SS}	4	3		Digital Ground Pins
	15	13		
	36	28		
	47	38		
	62	50		
	80	64

(1) I = Input, O = Output, Z = High Impedance, OD = Open Drain, \uparrow = Pullup, \downarrow = Pulldown

(2) The GPIO function (shown in bold italics) is the default at reset. The peripheral signals that are listed under them are alternate functions. For JTAG pins that have the GPIO functionality multiplexed, the input path to the GPIO block is always valid. The output path from the GPIO block and the path to the JTAG block from a pin is enabled or disabled based on the condition of the TRST signal. See the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual (SPRUH18)*.

(3) Depending on your USB application, additional pins may be required to maintain compliance with the USB 2.0 Specification. For more information, see the Universal Serial Bus (USB) Controller chapter of the *TMS320x2806x Piccolo Technical Reference Manual (SPRUH18)*.

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage	V _{DDIO} (I/O and Flash) with respect to V _{SS}	-0.3	4.6	V
	V _{DD} with respect to V _{SS}	-0.3	2.5	
Analog voltage	V _{DDA} with respect to V _{SSA}	-0.3	4.6	V
Input voltage	V _{IN} (3.3 V)	-0.3	4.6	V
	V _{IN} (X1)	-0.3	2.5	
Output voltage	V _O	-0.3	4.6	V
Input clamp current	I _{IK} (V _{IN} < 0 or V _{IN} > V _{DDIO}) ⁽³⁾	-20	20	mA
Output clamp current	I _{OK} (V _O < 0 or V _O > V _{DDIO})	-20	20	mA
Junction temperature ⁽⁴⁾	T _J	-40	150	°C
Storage temperature ⁽⁴⁾	T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.4](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}, unless otherwise noted.
- (3) Continuous clamp current per pin is ±2 mA.
- (4) Long-term high-temperature storage or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see the *IC Package Thermal Metrics Application Report (SPRA953)*.

5.2 ESD Ratings for TMS320F2806xU

		VALUE	UNIT
V _(ESD)	Electrostatic discharge (ESD)	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 ESD Ratings for TMS320F2806x, TMS320F2806xM, and TMS320F2806xF

			VALUE	UNIT
TMS320F2806x, TMS320F2806xM, and TMS320F2806xF in 100-pin PZ and PZP packages				
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins	±2000
		Charged device model (CDM), per AEC Q100-011	All pins	±500
			Corner pins on 100-pin PZ and PZP: 1, 25, 26, 50, 51, 75, 76, 100	±750
TMS320F2806x, TMS320F2806xM, and TMS320F2806xF in 80-pin PN and PFP packages				
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins	±2000
		Charged device model (CDM), per AEC Q100-011	All pins	±500
			Corner pins on 80-pin PN and PFP: 1, 20, 21, 40, 41, 60, 61, 80	±750

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Device supply voltage, I/O, V_{DDIO}		2.97	3.3	3.63	V
Device supply voltage CPU, V_{DD} (When internal VREG is disabled and 1.8 V is supplied externally)		1.71	1.8	1.995	V
Supply ground, V_{SS}			0		V
Analog supply voltage, V_{DDA}		2.97	3.3	3.63	V
Analog ground, V_{SSA}			0		V
Device clock frequency (system clock)		2		90	MHz
High-level input voltage, V_{IH} (3.3 V)		2		$V_{DDIO} + 0.3$	V
Low-level input voltage, V_{IL} (3.3 V)		$V_{SS} - 0.3$		0.8	V
High-level output source current, $V_{OH} = V_{OH(MIN)}$, I_{OH}		All GPIO/AIO pins		-4	mA
		Group 2 ⁽¹⁾		-8	
Low-level output sink current, $V_{OL} = V_{OL(MAX)}$, I_{OL}		All GPIO/AIO pins		4	mA
		Group 2 ⁽¹⁾		8	
Junction temperature, T_J		T version		105	°C
		S version		125	
Ambient temperature, T_A		Q version ⁽²⁾ (Q100 qualification)		125	°C

(1) Group 2 pins are as follows: GPIO16, GPIO17, GPIO18, GPIO19, GPIO28, GPIO29, GPIO36, GPIO37.

(2) The "Q" temperature option is **not** available on the 2806xU devices.

5.5 Electrical Characteristics⁽¹⁾

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT	
V_{OH}	High-level output voltage	$I_{OH} = I_{OH\ MAX}$		2.4			V	
		$I_{OH} = 50\ \mu A$		$V_{DDIO} - 0.2$				
V_{OL}	Low-level output voltage	$I_{OL} = I_{OL\ MAX}$		0.4			V	
I_{IL}	Input current (low level)	Pin with pullup enabled	$V_{DDIO} = 3.3\ V, V_{IN} = 0\ V$	All GPIO	-80	-140	-205	μA
				\overline{XRS} pin	-230	-300	-375	
I_{IH}	Input current (high level)	Pin with pulldown enabled	$V_{DDIO} = 3.3\ V, V_{IN} = 0\ V$				± 2	μA
		Pin with pullup enabled	$V_{DDIO} = 3.3\ V, V_{IN} = V_{DDIO}$				± 2	
I_{IH}	Input current (high level)	Pin with pullup enabled	$V_{DDIO} = 3.3\ V, V_{IN} = V_{DDIO}$				± 2	μA
		Pin with pulldown enabled	$V_{DDIO} = 3.3\ V, V_{IN} = V_{DDIO}$	28	50	80		
I_{OZ}	Output current, pullup or pulldown disabled	$V_O = V_{DDIO}$ or 0 V					± 2	μA
C_I	Input capacitance			2			pF	
	V_{DDIO} BOR trip point	Falling V_{DDIO}		2.50	2.78	2.96	V	
	V_{DDIO} BOR hysteresis			35			mV	
	Supervisor reset release delay time	Time after BOR/POR/OVR event is removed to \overline{XRS} release		400		800	μs	
	VREG V_{DD} output	Internal VREG on		1.9			V	

(1) When the on-chip VREG is used, its output is monitored by the POR/BOR circuit, which will reset the device should the core voltage (V_{DD}) go out of range.

5.6 Power Consumption Summary

Table 5-1. TMS320F2806x Current Consumption at 90-MHz SYSCLKOUT

MODE	TEST CONDITIONS	VREG ENABLED						VREG DISABLED							
		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾		I _{DD3VFL}		I _{DD}		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾		I _{DD3VFL}	
		TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX

All I/O pins are left unconnected. ^{(4) (5)} Code is running out of flash with 3 wait-states. XCLKOUT is turned off.	185 mA ⁽⁶⁾	245 mA ⁽⁶⁾	16 mA	22 mA	35 mA	40 mA	165 mA ⁽⁶⁾	220 mA ⁽⁶⁾	15 mA	20 mA	16 mA	22 mA	35 mA	40 mA
IDLE	Flash is powered down. XCLKOUT is turned off. All peripheral clocks are turned off.	22 mA	27 mA	15 μA	25 μA	5 μA	10 μA	21 mA	26 mA	120 μA	400 μA	15 μA	25 μA	5 μA	10 μA
STANDBY	Flash is powered down. Peripheral clocks are off.	9 mA	11 mA	15 μA	25 μA	5 μA	10 μA	8 mA	10 mA	120 μA	400 μA	15 μA	25 μA	5 μA	10 μA
HALT	Flash is powered down. Peripheral clocks are off. Input clock is disabled. ⁽⁷⁾	75 μA		15 μA	25 μA	5 μA	10 μA	25 μA ⁽⁸⁾		40 μA		15 μA	25 μA	5 μA	10 μA

- (1) I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- (2) In order to realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- (3) The TYP numbers are applicable over room temperature and nominal voltage.
- (4) The following is done in a loop:
 - Data is continuously transmitted out of SPI-A, SPI-B, SCI-A, eCAN-A, McBSP-A, and I²C ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1 and COMP2 are continuously switching voltages.
 - GPIO17 is toggled.
- (5) CLA is continuously performing polynomial calculations.
- (6) For F2806x devices that do not have CLA, subtract the I_{DD} current number for CLA (see [Table 5-2](#)) from the I_{DD} (VREG disabled)/I_{DDIO} (VREG enabled) current numbers shown in [Table 5-1](#) for operational mode.
- (7) If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.
- (8) To realize the I_{DD} number shown for HALT mode, the following must be done:
 - PLL2 must be shut down by clearing bit 2 of the PLLCTL register.
 - A value of 0x00FF must be written to address 0x6822.

NOTE

The peripheral - I/O multiplexing implemented in the device prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

5.6.1 Reducing Current Consumption

The 2806x devices incorporate a method to reduce the device current consumption. Since each peripheral unit has an individual clock-enable bit, significant reduction in current consumption can be achieved by turning off the clock to any peripheral module that is not used in a given application. Furthermore, any one of the three low-power modes could be taken advantage of to reduce the current consumption even further. [Table 5-2](#) indicates the typical reduction in current consumption achieved by turning off the clocks.

Table 5-2. Typical Current Consumption by Various Peripherals (at 90 MHz)⁽¹⁾

PERIPHERAL MODULE ⁽²⁾	I _{DD} CURRENT REDUCTION (mA)
ADC	2 ⁽³⁾
I ² C	3
ePWM	2
eCAP	2
eQEP	2
SCI	2
SPI	2
COMP/DAC	1
HRPWM	3
HRCAP	3
USB	12
CPU-TIMER	1
Internal zero-pin oscillator	0.5
CAN	2.5
CLA	20
McBSP	6

- (1) All peripheral clocks (except CPU Timer clock) are disabled upon reset. Writing to or reading from peripheral registers is possible only after the peripheral clocks are turned on.
- (2) For peripherals with multiple instances, the current quoted is per module. For example, the 2 mA value quoted for ePWM is for one ePWM module.
- (3) This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC (I_{DDA}) as well.

NOTE

I_{DDIO} current consumption is reduced by 15 mA (typical) when XCLKOUT is turned off.

NOTE

The baseline I_{DD} current (current when the core is executing a dummy loop with no peripherals enabled) is 40 mA, typical. To arrive at the I_{DD} current for a given application, the current-drawn by the peripherals (enabled by that application) must be added to the baseline I_{DD} current.

Following are other methods to reduce power consumption further:

- The flash module may be powered down if code is run off SARAM. This results in a current reduction of 18 mA (typical) in the V_{DD} rail and 13 mA (typical) in the V_{DDIO} rail.
- Savings in I_{DDIO} may be realized by disabling the pullups on pins that assume an output function.

5.6.2 Current Consumption Graphs (VREG Enabled)

Figure 5-1. Typical Operational Current Versus Frequency

Figure 5-2. Typical Operational Power Versus Frequency

5.7 Thermal Resistance Characteristics

5.7.1 PFP PowerPAD Package

		°C/W ⁽¹⁾	AIR FLOW (lfm) ⁽²⁾
R _{θJC}	Junction-to-case thermal resistance	9.4	0
R _{θJB}	Junction-to-board thermal resistance	4.6	0
R _{θJA} (High k PCB)	Junction-to-free air thermal resistance	25.8	0

 - JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*
- (2) lfm = linear feet per minute

5.8 Thermal Design Considerations

Based on the end application design and operational profile, the I_{DD} and I_{DDIO} currents could vary. Systems that exceed the recommended maximum power dissipation in the end product may require additional thermal enhancements. Ambient temperature (T_A) varies with the end application and product design. The critical factor that affects reliability and functionality is T_J , the junction temperature, not the ambient temperature. Hence, care should be taken to keep T_J within the specified limits. T_{case} should be measured to estimate the operating junction temperature T_J . T_{case} is normally measured at the center of the package top-side surface. The thermal application report *IC Package Thermal Metrics* (SPRA953) helps to understand the thermal metrics and definitions.

5.9 Emulator Connection Without Signal Buffering for the MCU

Figure 5-3 shows the connection between the MCU and JTAG header for a single-processor configuration. If the distance between the JTAG header and the MCU is greater than 6 inches, the emulation signals must be buffered. If the distance is less than 6 inches, buffering is typically not needed. Figure 5-3 shows the simpler, no-buffering situation. For the pullup and pulldown resistor values, see Section 4.2.

A. See Figure 6-54 for JTAG/GPIO multiplexing.

Figure 5-3. Emulator Connection Without Signal Buffering for the MCU

NOTE

The 2806x devices do not have EMU0/EMU1 pins. For designs that have a JTAG Header onboard, the EMU0/EMU1 pins on the header must be tied to V_{DDIO} through a 4.7-k Ω (typical) resistor.

5.10 Parameter Information

5.10.1 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

LOWERCASE SUBSCRIPTS AND THEIR MEANINGS:		LETTERS AND SYMBOLS AND THEIR MEANINGS:	
a	access time	H	High
c	cycle time (period)	L	Low
d	delay time	V	Valid
f	fall time	X	Unknown, changing, or don't care level
h	hold time	Z	High impedance
r	rise time		
su	setup time		
t	transition time		
v	valid time		
w	pulse duration (width)		

5.10.2 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

5.11 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

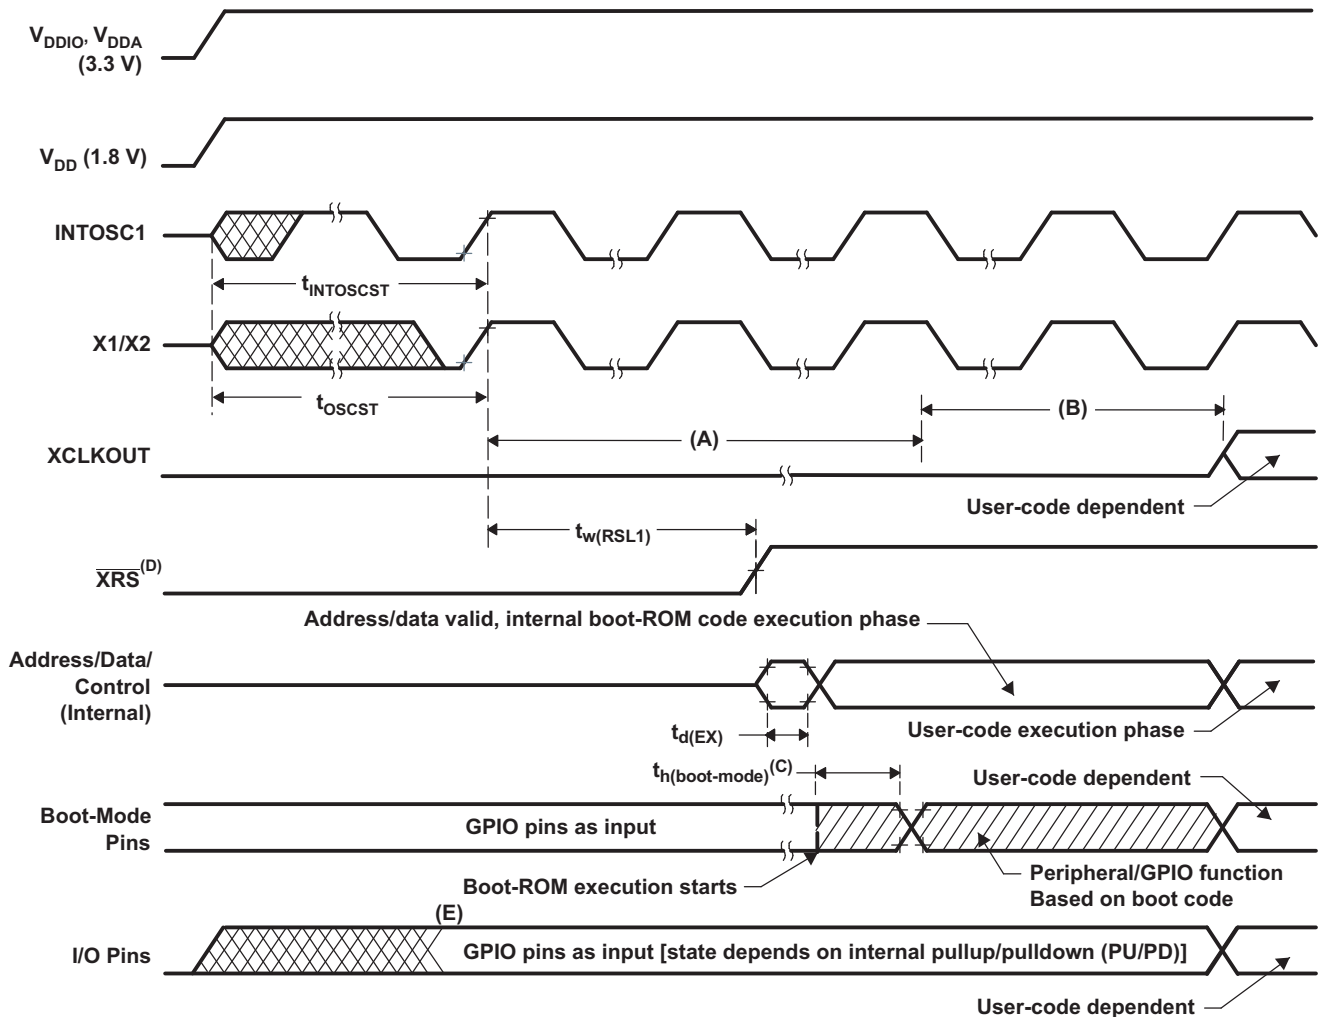

- Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.
- The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Figure 5-4. 3.3-V Test Load Circuit

5.12 Power Sequencing

There is no power sequencing requirement needed to ensure the device is in the proper state after reset or to prevent the I/Os from glitching during power up or power down (GPIO19, GPIO26–27, GPIO34–38 do not have glitch-free I/Os). No voltage larger than a diode drop (0.7 V) above V_{DDIO} should be applied to any digital pin before powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

- Upon power up, SYSCCLKOUT is OSCCLK/4. Since the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, SYSCCLKOUT is further divided by 4 before it appears at XCLKOUT. $XCLKOUT = OSCCLK/16$ during this phase.
- Boot ROM configures the DIVSEL bits for /1 operation. $XCLKOUT = OSCCLK/4$ during this phase. Note that XCLKOUT will not be visible at the pin until explicitly configured by user code.
- After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current SYSCCLKOUT speed. The SYSCCLKOUT will be based on user environment and could be with or without PLL enabled.
- Using the \overline{XRS} pin is optional due to the on-chip POR circuitry.
- The internal pullup or pulldown will take effect when BOR is driven high.

Figure 5-5. Power-on Reset

Table 5-3. Reset ($\overline{\text{XRS}}$) Timing Requirements

		MIN	MAX	UNIT
$t_{h(\text{boot-mode})}$	Hold time for boot-mode pins		$1000t_{c(\text{SCO})}$	cycles
$t_{w(\text{RSL2})}$	Pulse duration, $\overline{\text{XRS}}$ low on warm reset		$32t_{c(\text{OSCCLK})}$	cycles

Table 5-4. Reset ($\overline{\text{XRS}}$) Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	TYP	MAX	UNIT
$t_{w(\text{RSL1})}$	Pulse duration, $\overline{\text{XRS}}$ driven by device		600		μs
$t_{w(\text{WDRS})}$	Pulse duration, reset pulse generated by watchdog		$512t_{c(\text{OSCCLK})}$		cycles
$t_{d(\text{EX})}$	Delay time, address/data valid after $\overline{\text{XRS}}$ high		$32t_{c(\text{OSCCLK})}$		cycles
t_{INTOSCST}	Start up time, internal zero-pin oscillator		3		μs
$t_{\text{OSCST}}^{(1)}$	On-chip crystal-oscillator start-up time	1	10		ms

(1) Dependent on crystal/resonator and board design.

- A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 5-6. Warm Reset

Figure 5-7 shows an example for the effect of writing into PLLCR register. In the first phase, PLLCR = 0x0004 and SYSCLKOUT = OSCCLK × 2. The PLLCR is then written with 0x0008. Right after the PLLCR register is written, the PLL lock-up phase begins. During this phase, SYSCLKOUT = OSCCLK/2. After the PLL lock-up is complete, SYSCLKOUT reflects the new operating frequency, OSCCLK × 4.

Figure 5-7. Example of Effect of Writing Into PLLCR Register

5.13 Clock Specifications

5.13.1 Device Clock Table

This section provides the timing requirements and switching characteristics for the various clock options available on the 2806x MCUs. [Table 5-5](#) lists the cycle times of various clocks.

Table 5-5. 2806x Clock Table and Nomenclature (90-MHz Devices)

		MIN	NOM	MAX	UNIT
SYSCLKOUT	$t_{c(SCO)}$, Cycle time	11.11		500	ns
	Frequency	2		90	MHz
LSPCLK ⁽¹⁾	$t_{c(LCO)}$, Cycle time	11.11	44.4 ⁽²⁾		ns
	Frequency		22.5 ⁽²⁾	90	MHz
ADC clock	$t_{c(ADCCLK)}$, Cycle time	22.22			ns
	Frequency			45	MHz

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 90 MHz.

Table 5-6. Device Clocking Requirements/Characteristics

		MIN	NOM	MAX	UNIT
On-chip oscillator (X1/X2 pins) (Crystal/Resonator)	$t_{c(OSC)}$, Cycle time	50		200	ns
	Frequency	5		20	MHz
External oscillator/clock source (XCLKIN pin) — PLL Enabled	$t_{c(CI)}$, Cycle time (C8)	33.3		200	ns
	Frequency	5		30	MHz
External oscillator/clock source (XCLKIN pin) — PLL Disabled	$t_{c(CI)}$, Cycle time (C8)	11.11		250	ns
	Frequency	4		90	MHz
Limp mode SYSCLKOUT (with /2 enabled)	Frequency range		1 to 5		MHz
XCLKOUT	$t_{c(XCO)}$, Cycle time (C1)	44.44		2000	ns
	Frequency	0.5		22.5	MHz
PLL lock time ⁽¹⁾	t_p			1	ms

- (1) The PLLLOCKPRD register must be updated based on the number of OSCCLK cycles. If the zero-pin internal oscillators (10 MHz) are used as the clock source, then the PLLLOCKPRD register must be written with a value of 10,000 (minimum).

Table 5-7. Internal Zero-Pin Oscillator (INTOSC1/INTOSC2) Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
Internal zero-pin oscillator 1 (INTOSC1) at 30°C ⁽¹⁾⁽²⁾	Frequency		10.000		MHz
Internal zero-pin oscillator 2 (INTOSC2) at 30°C ⁽¹⁾⁽²⁾	Frequency		10.000		MHz
Step size (coarse trim)			55		kHz
Step size (fine trim)			14		kHz
Temperature drift ⁽³⁾			3.03	4.85	kHz/°C
Voltage (V _{DD}) drift ⁽³⁾			175		Hz/mV

- (1) In order to achieve better oscillator accuracy (10 MHz ± 1% or better) than shown, refer to the *Oscillator Compensation Guide Application Report (SPRAB84)*.
- (2) Frequency range ensured only when VREG is enabled, $\overline{VREGENZ} = V_{SS}$.
- (3) Output frequency of the internal oscillators follows the direction of both the temperature gradient and voltage (V_{DD}) gradient. For example:
- Increase in temperature will cause the output frequency to increase per the temperature coefficient.
 - Decrease in voltage (V_{DD}) will cause the output frequency to decrease per the voltage coefficient.

Figure 5-8. Zero-Pin Oscillator Frequency Movement With Temperature

5.13.2 Clock Requirements and Characteristics

Table 5-8. XCLKIN Timing Requirements - PLL Enabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN		6	ns
C10	$t_{r(CI)}$	Rise time, XCLKIN		6	ns
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45%	55%	
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45%	55%	

Table 5-9. XCLKIN Timing Requirements - PLL Disabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 90 MHz	2	
C10	$t_{r(CI)}$	Rise time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 90 MHz	2	
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45%	55%	
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45%	55%	

The possible configuration modes are shown in [Table 6-15](#).

Table 5-10. XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)⁽¹⁾⁽²⁾

over recommended operating conditions (unless otherwise noted)

NO.	PARAMETER	MIN	MAX	UNIT
C3	$t_{f(XCO)}$ Fall time, XCLKOUT		5	ns
C4	$t_{r(XCO)}$ Rise time, XCLKOUT		5	ns
C5	$t_{w(XCOL)}$ Pulse duration, XCLKOUT low	H - 2	H + 2	ns
C6	$t_{w(XCOH)}$ Pulse duration, XCLKOUT high	H - 2	H + 2	ns

(1) A load of 40 pF is assumed for these parameters.

(2) $H = 0.5t_{c(XCO)}$

A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown is intended to illustrate the timing parameters only and may differ based on actual configuration.

B. XCLKOUT configured to reflect SYSCLKOUT.

Figure 5-9. Clock Timing

5.14 Flash Timing

Table 5-11. Flash/OTP Endurance for T Temperature Material⁽¹⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	0°C to 105°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

Table 5-12. Flash/OTP Endurance for S Temperature Material⁽¹⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	0°C to 125°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

Table 5-13. Flash/OTP Endurance for Q Temperature Material⁽¹⁾⁽²⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	-40°C to 125°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	-40°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

(2) The "Q" temperature option is *not* available on the 2806xU devices.

Table 5-14. Flash Parameters at 90-MHz SYSCLKOUT

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Program Time	16-Bit Word			50		μs
	16K Sector			500		ms
	8K Sector			250		ms
	4K Sector			125		ms
Erase Time ⁽¹⁾	16K Sector			2		s
	8K Sector			2		
	4K Sector			2		
I _{DDP} ⁽²⁾	V _{DD} current consumption during Erase/Program cycle	VREG disabled		80		mA
I _{DDIOP} ⁽²⁾	V _{DDIO} current consumption during Erase/Program cycle			60		
I _{DDIOP} ⁽²⁾	V _{DDIO} current consumption during Erase/Program cycle	VREG enabled		120		mA

(1) The on-chip flash memory is in an erased state when the device is shipped from TI. As such, erasing the flash memory is not required before programming, when programming the device for the first time. However, the erase operation is needed on all subsequent programming operations.

(2) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.

Table 5-15. Flash/OTP Access Timing

PARAMETER		MIN	MAX	UNIT
$t_{a(fp)}$	Paged Flash access time	36		ns
$t_{a(fr)}$	Random Flash access time	36		ns
$t_{a(OTP)}$	OTP access time	60		ns

Table 5-16. Flash Data Retention Duration

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{retention}$	Data retention duration	$T_J = 55^\circ\text{C}$	15		years

Table 5-17. Minimum Required Flash/OTP Wait-States at Different Frequencies

SYSCLKOUT (MHz)	SYSCLKOUT (ns)	PAGE WAIT-STATE ⁽¹⁾	RANDOM WAIT-STATE ⁽¹⁾	OTP WAIT-STATE
90	11.11	3	3	5
80	12.5	2	2	4
70	14.29	2	2	4
60	16.67	2	2	3
55	18.18	1	1	3
50	20	1	1	2
45	22.22	1	1	2
40	25	1	1	2
35	28.57	1	1	2
30	33.33	1	1	1

(1) Page and random wait-state must be ≥ 1 .

The equations to compute the Flash page wait-state and random wait-state in [Table 5-17](#) are as follows:

$$\text{Flash Page Wait State} = \left\lceil \left(\frac{t_{a(fp)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

$$\text{Flash Random Wait State} = \left\lceil \left(\frac{t_{a(fr)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

The equation to compute the OTP wait-state in [Table 5-17](#) is as follows:

$$\text{OTP Wait State} = \left\lceil \left(\frac{t_{a(OTP)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

6 Detailed Description

6.1 Overview

6.1.1 CPU

The 2806x (C28x) family is a member of the TMS320C2000™ microcontroller (MCU) platform. The C28x-based controllers have the same 32-bit fixed-point architecture as existing C28x MCUs. Each C28x-based controller, including the 2806x device, is a very efficient C/C++ engine, enabling users to develop not only their system control software in a high-level language, but also enabling development of math algorithms using C/C++. The device is as efficient at MCU math tasks as it is at system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 × 32-bit MAC 64-bit processing capabilities enable the controller to handle higher numerical resolution problems efficiently. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The device has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables it to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

6.1.2 Control Law Accelerator (CLA)

The C28x control law accelerator is a single-precision (32-bit) floating-point unit that extends the capabilities of the C28x CPU by adding parallel processing. The CLA is an independent processor with its own bus structure, fetch mechanism, and pipeline. Eight individual CLA tasks, or routines, can be specified. Each task is started by software or a peripheral such as the ADC, ePWM, eCAP, eQEP, or CPU Timer 0. The CLA executes one task at a time to completion. When a task completes the main CPU is notified by an interrupt to the PIE and the CLA automatically begins the next highest-priority pending task. The CLA can directly access the ADC Result registers, ePWM+HRPWM, eCAP, and eQEP registers. Dedicated message RAMs provide a method to pass additional data between the main CPU and the CLA.

6.1.3 Viterbi, Complex Math, CRC Unit (VCU)

The C28x VCU enhances the processing power of C2000™ devices by adding additional assembly instructions to target complex math, Viterbi decode, and CRC calculations. The VCU instructions accelerate many applications, including the following:

- Orthogonal frequency-division multiplex (OFDM) used in the PRIME and G3 standards for power line communications
- Short-range radar complex math calculations
- Power calculations
- Memory and data communication packet checks (CRC)

The VCU features include:

- Instructions to support Cyclic Redundancy Checks (CRCs), which is a polynomial code checksum.
 - CRC8
 - CRC16
 - CRC32
- Instructions to support a flexible software implementation of a Viterbi decoder
 - Branch metric calculations for a code rate of 1/2 or 1/3
 - Add-Compare Select or Viterbi Butterfly in 5 cycles per butterfly
 - Traceback in 3 cycles per stage
 - Easily supports a constraint length of $K = 7$ used in PRIME and G3 standards
- Complex math arithmetic unit
 - Single-cycle Add or Subtract
 - 2-cycle multiply
 - 2-cycle multiply and accumulate (MAC)
 - Single-cycle repeat MAC
- Independent register space

6.1.4 Memory Bus (Harvard Bus Architecture)

As with many MCU-type devices, multiple busses are used to move data between the memories and peripherals and the CPU. The memory bus architecture contains a program read bus, data read bus, and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write busses consist of 32 address lines and 32 data lines each. The 32-bit-wide data busses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed Harvard Bus, enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus prioritize memory accesses. Generally, the priority of memory bus accesses can be summarized as follows:

Highest:	Data Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
	Program Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
	Data Reads	
	Program Reads	(Simultaneous program reads and fetches cannot occur on the memory bus.)
Lowest:	Fetches	(Simultaneous program reads and fetches cannot occur on the memory bus.)

6.1.5 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) MCU family of devices, the devices adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various busses that make up the processor Memory Bus into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Three versions of the peripheral bus are supported. One version supports only 16-bit accesses (called peripheral frame 2). Another version supports both 16- and 32-bit accesses (called peripheral frame 1).

6.1.6 Real-Time JTAG and Analysis

The devices implement the standard IEEE 1149.1 JTAG ⁽¹⁾ interface for in-circuit based debug. Additionally, the devices support real-time mode of operation allowing modification of the contents of memory, peripheral, and register locations while the processor is running and executing code and servicing interrupts. The user can also single step through non-time-critical code while enabling time-critical interrupts to be serviced without interference. The device implements the real-time mode in hardware within the CPU. This is a feature unique to the 28x family of devices, requiring no software monitor. Additionally, special analysis hardware is provided that allows setting of hardware breakpoint or data/address watch-points and generating various user-selectable break events when a match occurs.

6.1.7 Flash

The F28069, F28068, F28067, and F28066 devices contain 128K × 16 of embedded flash memory, segregated into eight 16K × 16 sectors. The F28065, F28064, F28063, and F28062 devices contain 64K × 16 of embedded flash memory, segregated into eight 8K × 16 sectors. All devices also contain a single 1K × 16 of OTP memory at address range 0x3D 7800 – 0x3D 7BF9. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase or program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data variables and should not contain program code.

NOTE

The Flash and OTP wait-states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait-states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait-state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent.

For more information on the Flash options, Flash wait-state, and OTP wait-state registers, see the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual* ([SPRUH18](#)).

(1) IEEE Standard 1149.1-1990 Standard Test Access Port and Boundary Scan Architecture

6.1.8 M0, M1 SARAMs

All devices contain these two blocks of single-access memory, each 1K × 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

6.1.9 L4 SARAM, and L0, L1, L2, L3, L5, L6, L7, and L8 DPSARAMs

The device contains up to 48K × 16 of single-access RAM. To ascertain the exact size for a given device, see the device-specific memory map figures in [Section 6.2](#). This block is mapped to both program and data space. L0 is 2K in size. L1 and L2 are each 1K in size. L3 is 4K in size. L4, L5, L6, L7, and L8 are each 8K in size. L0, L1, and L2 are shared with the CLA, which can use these blocks for its data space. L3 is shared with the CLA, which can use this block for its program space. L5, L6, L7, and L8 are shared with the DMA, which can use these blocks for its data space. DPSARAM refers to the dual-port configuration of these blocks.

6.1.10 Boot ROM

The Boot ROM is factory-programmed with boot-loading software. Boot-mode signals are provided to tell the bootloader software what boot mode to use on power up. The user can select to boot normally or to download new software from an external connection or to select boot software that is programmed in the internal Flash/ROM. The Boot ROM also contains standard tables, such as SIN/COS waveforms, for use in math-related algorithms.

Table 6-1. Boot Mode Selection

MODE	GPIO37/TDO	GPIO34/COMP2OUT/ COMP3OUT	$\overline{\text{TRST}}$	MODE
3	1	1	0	GetMode
2	1	0	0	Wait (see Section 6.1.11 for description)
1	0	1	0	SCI
0	0	0	0	Parallel IO
EMU	x	x	1	Emulation Boot

6.1.10.1 Emulation Boot

When the emulator is connected, the GPIO37/TDO pin cannot be used for boot mode selection. In this case, the boot ROM detects that an emulator is connected and uses the contents of two reserved SARAM locations in the PIE vector table to determine the boot mode. If the content of either location is invalid, then the *Wait* boot option is used. All boot mode options can be accessed in emulation boot.

6.1.10.2 GetMode

The default behavior of the *GetMode* option is to boot to flash. This behavior can be changed to another boot option by programming two locations in the OTP. If the content of either OTP location is invalid, then boot to flash is used. One of the following loaders can be specified: SCI, SPI, I²C, CAN, or OTP.

6.1.10.3 Peripheral Pins Used by the Bootloader

Table 6-2 shows which GPIO pins are used by each peripheral bootloader. Refer to the GPIO mux table to see if these conflict with any of the peripherals you would like to use in your application.

Table 6-2. Peripheral Bootload Pins

BOOTLOADER	PERIPHERAL LOADER PINS
SCI	SCIRXDA (GPIO28) SCITXDA (GPIO29)
Parallel Boot	Data (GPIO31,30,5:0) 28x Control (AIO6) Host Control (AIO12)
SPI	SPISIMOA (GPIO16) SPISOMIA (GPIO17) SPICLKA (GPIO18) SPISTEA (GPIO19)
I ² C	SDAA (GPIO32) SCLA (GPIO33)
CAN	CANRXA (GPIO30) CANTXA (GPIO31)

6.1.11 Security

The devices support high levels of security to protect the user firmware from being reverse-engineered. The security features a 128-bit password (hardcoded for 16 wait-states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents through the JTAG port, executing code from external memory or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit KEY value that matches the value stored in the password locations within the Flash.

In addition to the CSM, the emulation code security logic (ECSL) has been implemented to prevent unauthorized users from stepping through secure code. Any code or data access to CSM secure memory while the emulator is connected will trip the ECSL and break the emulation connection. To allow emulation of secure code, while maintaining the CSM protection against secure memory reads, the user must write the correct value into the lower 64 bits of the KEY register, which matches the value stored in the lower 64 bits of the password locations within the flash. Note that dummy reads of all 128 bits of the password in the flash must still be performed. If the lower 64 bits of the password locations are all ones (unprogrammed), then the KEY value does not need to match.

When initially debugging a device with the password locations in flash programmed (that is, secured), the CPU will start running and may execute an instruction that performs an access to a protected ECSL area. If this happens, the ECSL will trip and cause the emulator connection to be cut.

The solution is to use the *Wait* boot option. This will sit in a loop around a software breakpoint to allow an emulator to be connected without tripping security. Piccolo devices do not support a hardware wait-in-reset mode.

NOTE

- When the code-security passwords are programmed, all addresses between 0x3F 7F80 and 0x3F 7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
 - If the code security feature is not used, addresses 0x3F 7F80 through 0x3F 7FEF may be used for code or data. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data and should not contain program code.
 - The 128-bit password (at 0x3F 7FF8 – 0x3F 7FFF) **must not** be programmed to zeros. Doing so would permanently lock the device.
-

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

6.1.12 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F2806x, 72 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. Eight CPU clock cycles are needed to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled or disabled within the PIE block.

6.1.13 External Interrupts (XINT1–XINT3)

The devices support three masked external interrupts (XINT1–XINT3). Each of the interrupts can be selected for negative, positive, or both negative and positive edge triggering and can also be enabled or disabled. These interrupts also contain a 16-bit free-running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time-stamp the interrupt. There are no dedicated pins for the external interrupts. XINT1, XINT2, and XINT3 interrupts can accept inputs from GPIO0–GPIO31 pins.

6.1.14 Internal Zero Pin Oscillators, Oscillator, and PLL

The device can be clocked by either of the two internal zero-pin oscillators, an external oscillator, or by a crystal attached to the on-chip oscillator circuit. A PLL is provided supporting up to 16 input-clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to [Section 5](#), Specifications, for timing details. The PLL block can be set in bypass mode. A second PLL (PLL2) feeds the HRCAP module.

6.1.15 Watchdog

Each device contains two watchdogs: CPU-watchdog that monitors the core and NMI-watchdog that is a missing clock-detect circuit. The user software must regularly reset the CPU-watchdog counter within a certain time frame; otherwise, the CPU-watchdog generates a reset to the processor. The CPU-watchdog can be disabled if necessary. The NMI-watchdog engages only in case of a clock failure and can either generate an interrupt or a device reset.

6.1.16 Peripheral Clocking

The clocks to each individual peripheral can be enabled or disabled to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except I²C) can be scaled relative to the CPU clock.

6.1.17 Low-power Modes

The devices are full static CMOS devices. Three low-power modes are provided:

- IDLE:** Places CPU in low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that need to function during IDLE are left operating. An enabled interrupt from an active peripheral or the watchdog timer will wake the processor from IDLE mode.
- STANDBY:** Turns off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event
- HALT:** This mode basically shuts down the device and places it in the lowest possible power-consumption mode. If the internal zero-pin oscillators are used as the clock source, the HALT mode turns them off, by default. To keep these oscillators from shutting down, the INTOSCnHALTI bits in CLKCTL register may be used. The zero-pin oscillators may thus be used to clock the CPU-watchdog in this mode. If the on-chip crystal oscillator is used as the clock source, it is shut down in this mode. A reset or an external signal (through a GPIO pin) or the CPU-watchdog can wake the device from this mode.

The CPU clock (OSCCLK) and WDCLK should be from the same clock source before attempting to put the device into HALT or STANDBY.

6.1.18 Peripheral Frames 0, 1, 2, 3 (PFn)

The device segregates peripherals into four sections. The mapping of peripherals is as follows:

PF0:	PIE:	PIE Interrupt Enable and Control Registers Plus PIE Vector Table
	Flash:	Flash Waitstate Registers
	Timers:	CPU-Timers 0, 1, 2 Registers
	CSM:	Code Security Module KEY Registers
	ADC:	ADC Result Registers
	CLA:	Control Law Accelerator Registers and Message RAMs
PF1:	GPIO:	GPIO MUX Configuration and Control Registers
	eCAN:	Enhanced Control Area Network Configuration and Control Registers
PF2:	SYS:	System Control Registers
	SCI:	Serial Communications Interface (SCI) Control and RX/TX Registers
	SPI:	Serial Port Interface (SPI) Control and RX/TX Registers
	ADC:	ADC Status, Control, and Configuration Registers
	I ² C:	Inter-Integrated Circuit Module and Registers
	XINT:	External Interrupt Registers
PF3:	McBSP:	Multichannel Buffered Serial Port Registers
	ePWM:	Enhanced Pulse Width Modulator Module and Registers
	eCAP:	Enhanced Capture Module and Registers
	eQEP:	Enhanced Quadrature Encoder Pulse Module and Registers
	Comparators:	Comparator Modules
	USB:	Universal Serial Bus Module and Registers

6.1.19 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose input/output (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, GPIO pins are configured as inputs. The user can individually program each pin for GPIO mode or peripheral signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches. The GPIO signals can also be used to bring the device out of specific low-power modes.

6.1.20 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presetable periods and with 16-bit clock prescaling. The timers have a 32-bit count-down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value.

CPU-Timer 0 is for general use and is connected to the PIE block. CPU-Timer 1 is also for general use and can be connected to INT13 of the CPU. CPU-Timer 2 is reserved for SYS/BIOS. CPU-Timer 2 is connected to INT14 of the CPU. If SYS/BIOS is not being used, CPU-Timer 2 is available for general use.

CPU-Timer 2 can be clocked by any one of the following:

- SYSCCLKOUT (default)
- Internal zero-pin oscillator 1 (INTOSC1)
- Internal zero-pin oscillator 2 (INTSOC2)
- External clock source

6.1.21 Control Peripherals

The devices support the following peripherals that are used for embedded control and communication:

ePWM:	The enhanced PWM peripheral supports independent/complementary PWM generation, adjustable dead-band generation for leading/trailing edges, latched/cycle-by-cycle trip mechanism. Some of the PWM pins support the HRPWM high-resolution duty and period features. The type 1 module found on 2806x devices also supports increased dead-band resolution, enhanced SOC and interrupt generation, and advanced triggering including trip functions based on comparator outputs.
eCAP:	The enhanced capture peripheral uses a 32-bit time base and registers up to four programmable events in continuous/one-shot capture modes. This peripheral can also be configured to generate an auxiliary PWM signal.
eQEP:	The enhanced QEP peripheral uses a 32-bit position counter, supports low-speed measurement using capture unit and high-speed measurement using a 32-bit unit timer. This peripheral has a watchdog timer to detect motor stall and input error detection logic to identify simultaneous edge transition in QEP signals.
ADC:	The ADC block is a 12-bit converter. The ADC has up to 16 single-ended channels pinned out, depending on the device. The ADC also contains two sample-and-hold units for simultaneous sampling.
Comparator:	Each comparator block consists of one analog comparator along with an internal 10-bit reference for supplying one input of the comparator.
HRCAP:	The high-resolution capture peripheral operates in normal capture mode through a 16-bit counter clocked off of the HCCAPCLK or in high-resolution capture mode by using built-in calibration logic in conjunction with a TI-supplied calibration library.

6.1.22 Serial Port Peripherals

The devices support the following serial communication peripherals:

- SPI:** The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (1 to 16 bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. The SPI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- SCI:** The serial communications interface is a 2-wire asynchronous serial port, commonly known as UART. The SCI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- I²C:** The inter-integrated circuit (I²C) module provides an interface between a MCU and other devices compliant with Philips Semiconductors Inter-IC bus (I²C-bus[®]) specification version 2.1 and connected by way of an I²C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to or from the MCU through the I²C module. The I²C contains a 4-level receive-and-transmit FIFO for reducing interrupt servicing overhead.
- eCAN:** This is the enhanced version of the CAN peripheral. The eCAN supports 32 mailboxes, time stamping of messages, and is compliant with ISO11898-1 (CAN 2.0B).
- McBSP:** The multichannel buffered serial port (McBSP) connects to E1/T1 lines, phone-quality codecs for modem applications or high-quality stereo audio DAC devices. The McBSP receive and transmit registers are supported by the DMA to significantly reduce the overhead for servicing this peripheral. Each McBSP module can be configured as an SPI as required.
- USB:** The USB peripheral, which conforms to the USB 2.0 specification, may be used as either a full-speed (12-Mbps) device controller, or a full-speed (12-Mbps) or low-speed (1.5-Mbps) host controller. The controller supports a total of six user-configurable endpoints—all of which can be accessed through DMA, in addition to a dedicated control endpoint for endpoint zero. All packets transmitted or received are buffered in 4KB of dedicated endpoint memory. The USB peripheral supports all four transfer types: Control, Interrupt, Bulk, and Isochronous. Because of the complexity of the USB peripheral and the associated protocol overhead, a full software library with application examples is provided within controlSUITE™.

6.2 Memory Maps

In [Figure 6-1](#) through [Figure 6-8](#), the following apply:

- Memory blocks are not to scale.
- Peripheral Frame 0, Peripheral Frame 1, Peripheral Frame 2, and Peripheral Frame 3 memory maps are restricted to data memory only. A user program cannot access these memory maps in program space.
- *Protected* means the order of Write-followed-by-Read operations is preserved rather than the pipeline order.
- Certain memory ranges are EALLOW protected against spurious writes after configuration.
- Locations 0x3D 7C80–0x3D 7CC0 contain the internal oscillator and ADC calibration routines. These locations are not programmable by the user.
- All devices with USB have the USB control registers mapped from 0x4000 to 0x4FFF and 2K ×16 RAM from 0x40000 to 0x40800. When the clock to the USB module is enabled, this RAM is connected to the USB controller and acts as the FIFO RAM. When the clock to the USB module is disabled, this RAM is remapped to the CPU-accessible address space and can be used as general-purpose RAM.

Table 6-3. Addresses of Flash Sectors in F28069, F28068, F28067, F28066

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3D 8000 – 0x3D BFFF	Sector H (16K x 16)
0x3D C000 – 0x3D FFFF	Sector G (16K x 16)
0x3E 0000 – 0x3E 3FFF	Sector F (16K x 16)
0x3E 4000 – 0x3E 7FFF	Sector E (16K x 16)
0x3E 8000 – 0x3E BFFF	Sector D (16K x 16)
0x3E C000 – 0x3E FFFF	Sector C (16K x 16)
0x3F 0000 – 0x3F 3FFF	Sector B (16K x 16)
0x3F 4000 – 0x3F 7FF5	Sector A (16K x 16)
0x3F 7FF6 – 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 – 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

Table 6-4. Addresses of Flash Sectors in F28065, F28064, F28063, F28062

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3E 8000 – 0x3E 9FFF	Sector H (8K x 16)
0x3E A000 – 0x3E BFFF	Sector G (8K x 16)
0x3E C000 – 0x3E DFFF	Sector F (8K x 16)
0x3E E000 – 0x3E FFFF	Sector E (8K x 16)
0x3F 0000 – 0x3F 1FFF	Sector D (8K x 16)
0x3F 2000 – 0x3F 3FFF	Sector C (8K x 16)
0x3F 4000 – 0x3F 5FFF	Sector B (8K x 16)
0x3F 6000 – 0x3F 7FF5	Sector A (8K x 16)
0x3F 7FF6 – 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 – 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

NOTE

Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data and should not contain program code.

Peripheral Frame 1 and Peripheral Frame 2 are grouped together to enable these blocks to be write/read peripheral block protected. The protected mode makes sure that all accesses to these blocks happen as written. Because of the pipeline, a write immediately followed by a read to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The CPU supports a block protection mode where a region of memory can be protected so that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it protects the selected zones.

The wait-states for the various spaces in the memory map area are listed in [Table 6-5](#).

Table 6-5. Wait-States

AREA	WAIT-STATES (CPU)	COMMENTS
M0 and M1 SARAMs	0-wait	Fixed
Peripheral Frame 0	0-wait	
Peripheral Frame 1	0-wait (writes) 2-wait (reads)	Cycles can be extended by peripheral-generated ready. Back-to-back write operations to Peripheral Frame 1 registers will incur a 1-cycle stall (1-cycle delay).
Peripheral Frame 2	0-wait (writes) 2-wait (reads)	Fixed. Cycles cannot be extended by the peripheral.
Peripheral Frame 3	0-wait (writes) 2-wait (reads)	Assumes no conflict between CPU and CLA/DMA cycles. The wait states can be extended by peripheral-generated ready.
L0–L8 SARAM	0-wait data and program	Assumes no CPU conflicts
OTP	Programmable 1-wait minimum	Programmed through the Flash registers. 1-wait is minimum number of wait states allowed.
FLASH	Programmable 0-wait Paged min 1-wait Random min Random ≥ Paged	Programmed through the Flash registers.
FLASH Password	16-wait fixed	Wait states of password locations are fixed.
Boot-ROM	0-wait	

6.3 Register Maps

The devices contain four peripheral register spaces. The spaces are categorized as follows:

Peripheral Frame 0: These are peripherals that are mapped directly to the CPU memory bus. See [Table 6-6](#).

Peripheral Frame 1: These are peripherals that are mapped to the 32-bit peripheral bus. See [Table 6-7](#).

Peripheral Frame 2: These are peripherals that are mapped to the 16-bit peripheral bus. See [Table 6-8](#).

Peripheral Frame 3: McBSP registers are mapped to this. See [Table 6-9](#).

Table 6-6. Peripheral Frame 0 Registers⁽¹⁾

NAME	ADDRESS RANGE	SIZE (x16)	EALLOW PROTECTED ⁽²⁾
Device Emulation registers	0x00 0880 – 0x00 0984	261	Yes
System Power Control registers	0x00 0985 – 0x00 0987	3	Yes
FLASH registers ⁽³⁾	0x00 0A80 – 0x00 0ADF	96	Yes
Code Security Module registers	0x00 0AE0 – 0x00 0AEF	16	Yes
ADC registers (0 wait read only)	0x00 0B00 – 0x00 0B0F	16	No
CPU-TIMER0, CPU-TIMER1, CPU-TIMER2 registers	0x00 0C00 – 0x00 0C3F	64	No
PIE registers	0x00 0CE0 – 0x00 0CFF	32	No
PIE Vector Table	0x00 0D00 – 0x00 0DFF	256	Yes
DMA registers	0x00 1000 – 0x00 11FF	512	Yes
CLA registers	0x00 1400 – 0x00 147F	128	Yes
CLA to CPU Message RAM (CPU writes ignored)	0x00 1480 – 0x00 14FF	128	NA
CPU to CLA Message RAM (CLA writes ignored)	0x00 1500 – 0x00 157F	128	NA

(1) Registers in Frame 0 support 16-bit and 32-bit accesses.

(2) If registers are EALLOW protected, then writes cannot be performed until the EALLOW instruction is executed. The EDIS instruction disables writes to prevent stray code or pointers from corrupting register contents.

(3) The Flash Registers are also protected by the Code Security Module (CSM).

Table 6-7. Peripheral Frame 1 Registers

NAME	ADDRESS RANGE	SIZE (x16)	EALLOW PROTECTED
eCAN-A registers	0x00 6000 – 0x00 61FF	512	(1)
HRCAP1 registers	0x00 6AC0 – 0x00 6ADF	32	(1)
HRCAP2 registers	0x00 6AE0 – 0x00 6AFF	32	(1)
HRCAP3 registers	0x00 6C80 – 0x00 6C9F	32	(1)

6.5 VREG, BOR, POR

Although the core and I/O circuitry operate on two different voltages, these devices have an on-chip VREG to generate the V_{DD} voltage from the V_{DDIO} supply. This eliminates the cost and space of a second external regulator on an application board. Additionally, internal power-on reset (POR) and brown-out reset (BOR) circuits monitor both the V_{DD} and V_{DDIO} rails during power-up and run mode.

6.5.1 On-chip VREG

A linear regulator generates the core voltage (V_{DD}) from the V_{DDIO} supply. Therefore, although capacitors are required on each V_{DD} pin to stabilize the generated voltage, power need not be supplied to these pins to operate the device. Conversely, the VREG can be disabled, should power or redundancy be the primary concern of the application.

6.5.1.1 Using the On-chip VREG

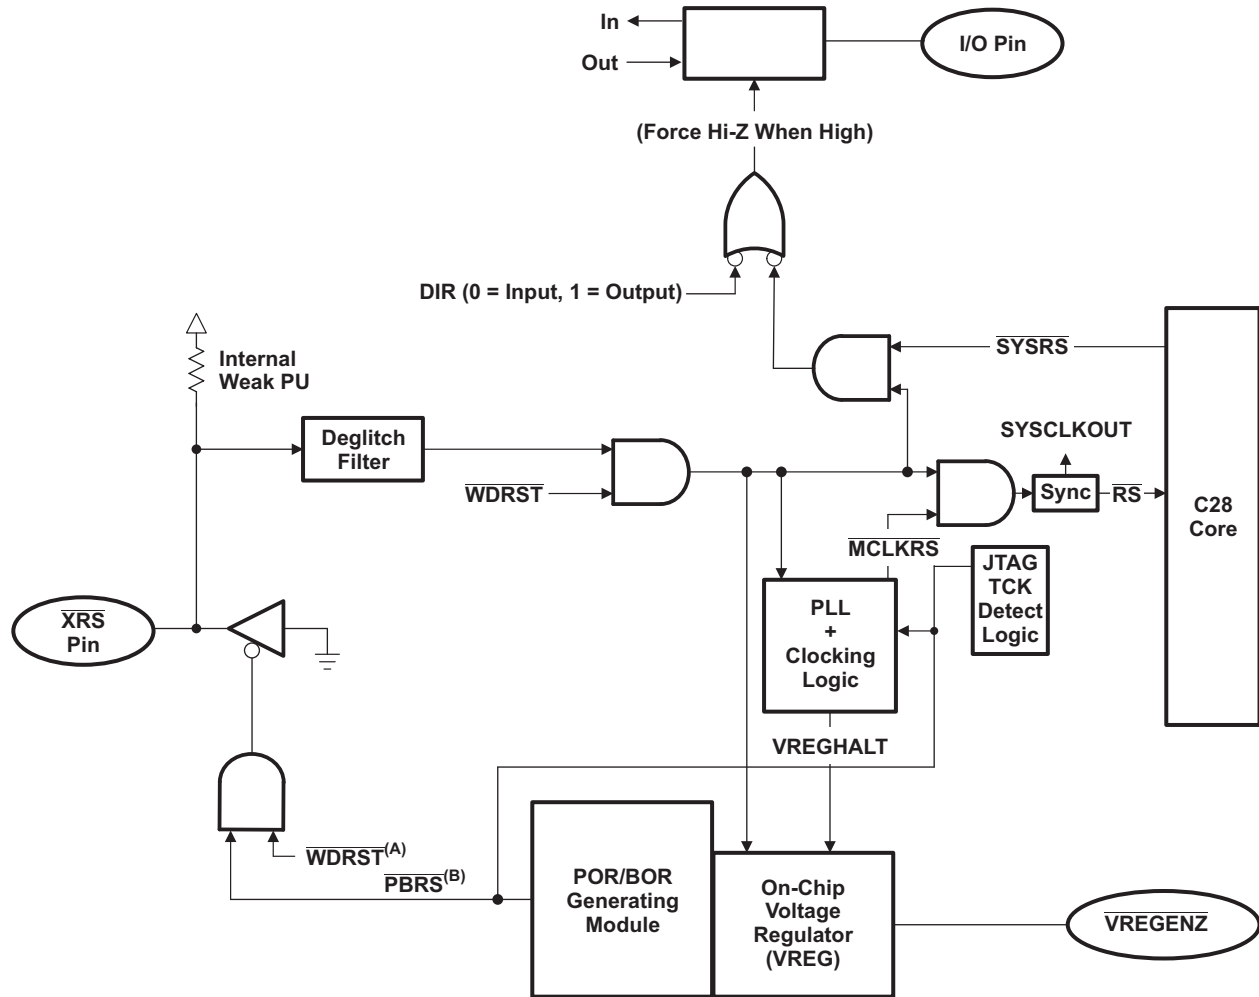

To use the on-chip VREG, the $\overline{\text{VREGENZ}}$ pin should be tied low and the appropriate recommended operating voltage should be supplied to the V_{DDIO} and V_{DDA} pins. In this case, the V_{DD} voltage needed by the core logic will be generated by the VREG. Each V_{DD} pin requires on the order of 1.2 μF (minimum) capacitance for proper regulation of the VREG. These capacitors should be located as close as possible to the V_{DD} pins.

6.5.1.2 Disabling the On-chip VREG

To conserve power, it is also possible to disable the on-chip VREG and supply the core logic voltage to the V_{DD} pins with a more efficient external regulator. To enable this option, the $\overline{\text{VREGENZ}}$ pin must be tied high.

6.5.2 On-chip Power-On Reset (POR) and Brown-Out Reset (BOR) Circuit

Two on-chip supervisory circuits, the power-on reset (POR) and the brown-out reset (BOR) remove the burden of monitoring the V_{DD} and V_{DDIO} supply rails from the application board. The purpose of the POR is to create a clean reset throughout the device during the entire power-up procedure. The trip point is a looser, lower trip point than the BOR, which watches for dips in the V_{DD} or V_{DDIO} rail during device operation. The POR function is present on both V_{DD} and V_{DDIO} rails at all times. After initial device power-up, the BOR function is present on V_{DDIO} at all times, and on V_{DD} when the internal VREG is enabled ($\overline{\text{VREGENZ}}$ pin is tied low). Both functions tie the $\overline{\text{XRS}}$ pin low when one of the voltages is below their respective trip point. Additionally, when the internal voltage regulator is enabled, an over-voltage protection circuit will tie $\overline{\text{XRS}}$ low if the V_{DD} rail rises above its trip point. See [Section 5](#) for the various trip points as well as the delay time for the device to release the $\overline{\text{XRS}}$ pin after the under-voltage or over-voltage condition is removed. [Figure 6-9](#) shows the VREG, POR, and BOR. To disable both the V_{DD} and V_{DDIO} BOR functions, a bit is provided in the BORCFG register. See the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual* ([SPRUH18](#)) for details.

- A. \overline{WDRST} is the reset signal from the CPU-watchdog.
- B. $\overline{PBR(S)}$ is the reset signal from the POR/BOR module.

Figure 6-9. VREG + POR + BOR + Reset Signal Connectivity

6.6 System Control

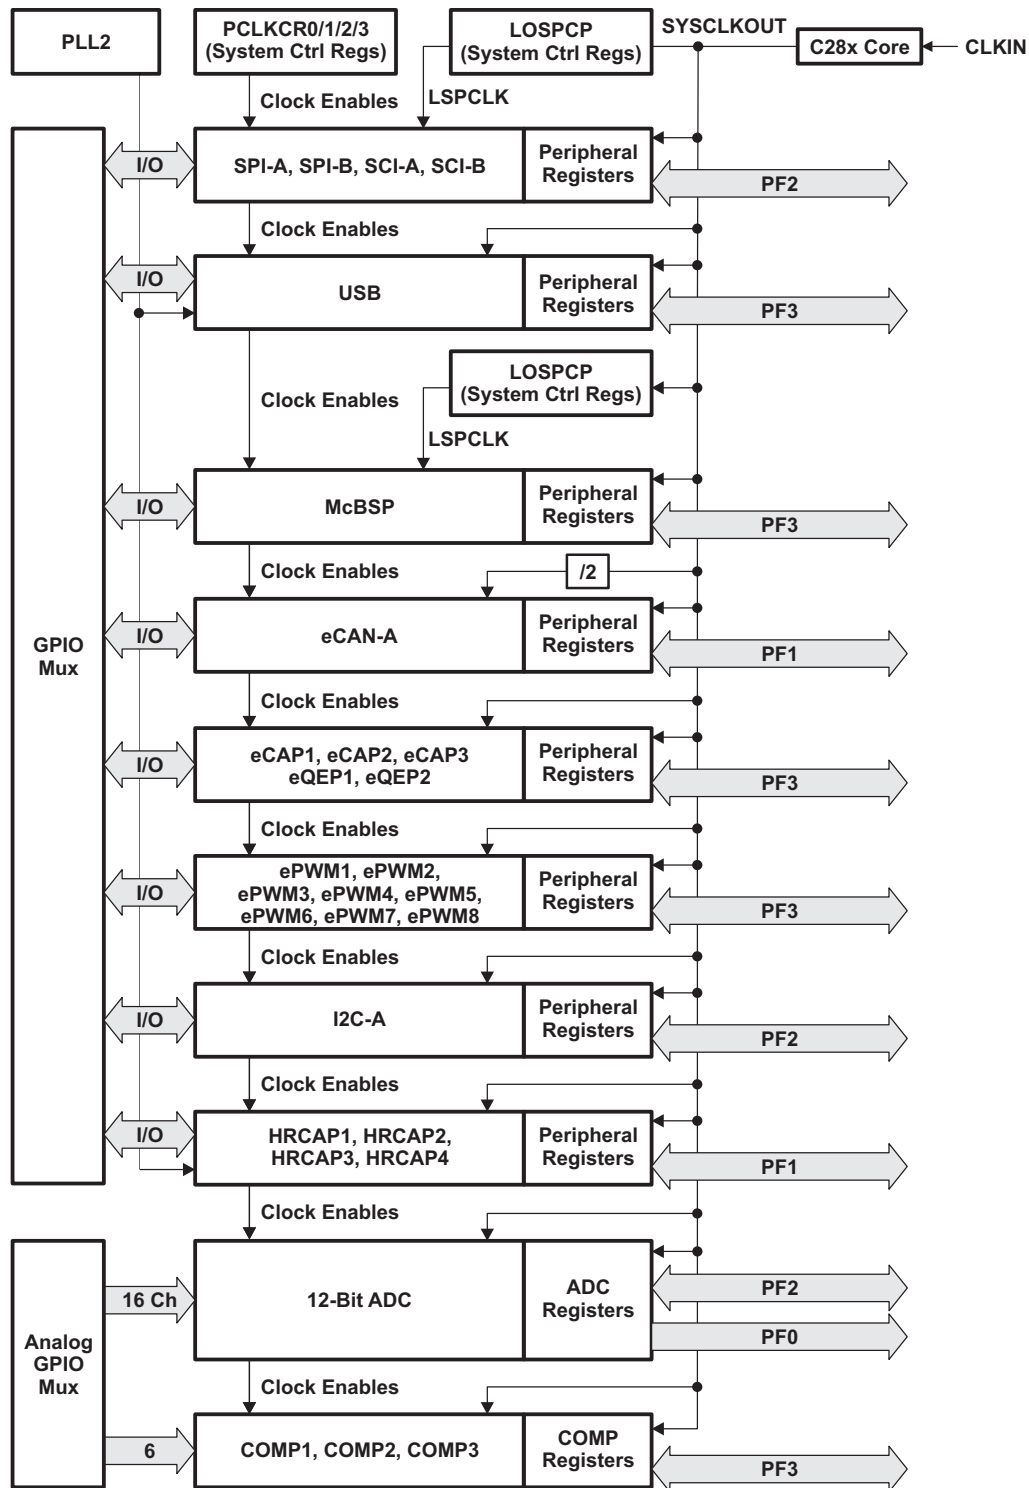

This section describes the oscillator and clocking mechanisms, the watchdog function and the low power modes.

Table 6-11. PLL, Clocking, Watchdog, and Low-Power Mode Registers

(1) All registers in this table are EALLOW protected.

Figure 6-10 shows the various clock domains that are discussed. Figure 6-11 shows the various clock sources (both internal and external) that can provide a clock for device operation.

- A. CLKIN is the clock into the CPU. CLKIN is passed out of the CPU as SYSCLKOUT (that is, CLKIN is the same frequency as SYSCLKOUT).

Figure 6-10. Clock and Reset Domains

- A. Register loaded from TI OTP-based calibration function.
 B. See Section 6.6.5 for details on missing clock detection.

Figure 6-11. Clock Tree

6.6.1 Internal Zero Pin Oscillators

The F2806x devices contain two independent internal zero pin oscillators. By default both oscillators are turned on at power up, and internal oscillator 1 is the default clock source at this time. For power savings, unused oscillators may be powered down by the user. The center frequency of these oscillators is determined by their respective oscillator trim registers, written to in the calibration routine as part of the boot ROM execution. See [Section 6.9](#) for more information on these oscillators.

6.6.2 Crystal Oscillator Option

The on-chip crystal oscillator X1 and X2 pins are 1.8-V level signals and must never have 3.3-V level signals applied to them. If a system 3.3-V external oscillator is to be used as a clock source, it should be connected to the XCLKIN pin only. The X1 pin is not intended to be used as a single-ended clock input, it should be used with X2 and a crystal.

The typical specifications for the external quartz crystal (fundamental mode, parallel resonant) are listed in [Table 6-12](#). Furthermore, ESR range = 30 to 150 Ω .

Table 6-12. Typical Specifications for External Quartz Crystal⁽¹⁾

FREQUENCY (MHz)	R _d (Ω)	C _{L1} (pF)	C _{L2} (pF)
5	2200	18	18
10	470	15	15
15	0	15	15
20	0	12	12

(1) C_{shunt} should be less than or equal to 5 pF.

Figure 6-12. Using the On-chip Crystal Oscillator

NOTE

1. C_{L1} and C_{L2} are the total capacitance of the circuit board and components excluding the IC and crystal. The value is usually approximately twice the value of the load capacitance of the crystal.
2. The load capacitance of the crystal is described in the crystal specifications of the manufacturers.
3. TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the MCU chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will produce proper start up and stability over the entire operating range.

Figure 6-13. Using a 3.3-V External Oscillator

6.6.3 PLL-Based Clock Module

The devices have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 5-bit ratio control PLLCR[DIV] to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. The watchdog module can be re-enabled (if need be) after the PLL module has stabilized, which takes 1 ms. The input clock and PLLCR[DIV] bits should be chosen in such a way that the output frequency of the PLL (VCOCLK) is at least 50 MHz.

Table 6-13. PLL Settings

PLLCR[DIV] VALUE ^{(1) (2)}	SYSCLKOUT (CLKIN)		
	PLLSTS[DIVSEL] = 0 or 1 ⁽³⁾	PLLSTS[DIVSEL] = 2	PLLSTS[DIVSEL] = 3
00000 (PLL bypass)	OSCCLK/4 (Default) ⁽¹⁾	OSCCLK/2	OSCCLK
00001	(OSCCLK * 1)/4	(OSCCLK * 1)/2	(OSCCLK * 1)/1
00010	(OSCCLK * 2)/4	(OSCCLK * 2)/2	(OSCCLK * 2)/1
00011	(OSCCLK * 3)/4	(OSCCLK * 3)/2	(OSCCLK * 3)/1
00100	(OSCCLK * 4)/4	(OSCCLK * 4)/2	(OSCCLK * 4)/1
00101	(OSCCLK * 5)/4	(OSCCLK * 5)/2	(OSCCLK * 5)/1
00110	(OSCCLK * 6)/4	(OSCCLK * 6)/2	(OSCCLK * 6)/1
00111	(OSCCLK * 7)/4	(OSCCLK * 7)/2	(OSCCLK * 7)/1
01000	(OSCCLK * 8)/4	(OSCCLK * 8)/2	(OSCCLK * 8)/1
01001	(OSCCLK * 9)/4	(OSCCLK * 9)/2	(OSCCLK * 9)/1
01010	(OSCCLK * 10)/4	(OSCCLK * 10)/2	(OSCCLK * 10)/1
01011	(OSCCLK * 11)/4	(OSCCLK * 11)/2	(OSCCLK * 11)/1
01100	(OSCCLK * 12)/4	(OSCCLK * 12)/2	(OSCCLK * 12)/1
01101	(OSCCLK * 13)/4	(OSCCLK * 13)/2	(OSCCLK * 13)/1
01110	(OSCCLK * 14)/4	(OSCCLK * 14)/2	(OSCCLK * 14)/1
01111	(OSCCLK * 15)/4	(OSCCLK * 15)/2	(OSCCLK * 15)/1
10000	(OSCCLK * 16)/4	(OSCCLK * 16)/2	(OSCCLK * 16)/1
10001	(OSCCLK * 17)/4	(OSCCLK * 17)/2	(OSCCLK * 17)/1
10010	(OSCCLK * 18)/4	(OSCCLK * 18)/2	(OSCCLK * 18)/1

- (1) The PLL control register (PLLCR) and PLL Status Register (PLLSTS) are reset to their default state by the \overline{XRS} signal or a watchdog reset only. A reset issued by the debugger or the missing clock detect logic has no effect.
- (2) This register is EALLOW protected. See the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual (SPRUH18)* for more information.
- (3) By default, PLLSTS[DIVSEL] is configured for /4. (The boot ROM changes this to /1.) PLLSTS[DIVSEL] must be 0 before writing to the PLLCR and should be changed only after PLLSTS[PLLLOCKS] = 1.

Table 6-14. CLKIN Divide Options

PLLSTS [DIVSEL]	CLKIN DIVIDE
0	/4
1	/4
2	/2
3	/1

The PLL-based clock module provides four modes of operation:

- **INTOSC1 (Internal Zero-pin Oscillator 1):** This is the on-chip internal oscillator 1. This can provide the clock for the Watchdog block, core and CPU-Timer 2
- **INTOSC2 (Internal Zero-pin Oscillator 2):** This is the on-chip internal oscillator 2. This can provide the clock for the Watchdog block, core and CPU-Timer 2. Both INTOSC1 and INTOSC2 can be independently chosen for the Watchdog block, core and CPU-Timer 2.
- **Crystal/Resonator Operation:** The on-chip (crystal) oscillator enables the use of an external crystal/resonator attached to the device to provide the time base. The crystal/resonator is connected to the X1/X2 pins. Some devices may not have the X1/X2 pins. See [Table 4-1](#) for details.
- **External Clock Source Operation:** If the on-chip (crystal) oscillator is not used, this mode allows it to be bypassed. The device clocks are generated from an external clock source input on the XCLKIN pin. Note that the XCLKIN is multiplexed with GPIO19 or GPIO38 pin. The XCLKIN input can be selected as GPIO19 or GPIO38 through the XCLKINSEL bit in XCLK register. The CLKCTL[XCLKINOFF] bit disables this clock input (forced low). If the clock source is not used or the respective pins are used as GPIOs, the user should disable at boot time.

Before changing clock sources, ensure that the target clock is present. If a clock is not present, then that clock source must be disabled (using the CLKCTL register) before switching clocks.

Table 6-15. Possible PLL Configuration Modes

PLL MODE	REMARKS	PLLSTS[DIVSEL]	CLKIN AND SYSCLKOUT
PLL Off	Invoked by the user setting the PLLOFF bit in the PLLSTS register. The PLL block is disabled in this mode. This can be useful to reduce system noise and for low power operation. The PLLCR register must first be set to 0x0000 (PLL Bypass) before entering this mode. The CPU clock (CLKIN) is derived directly from the input clock on either X1/X2, X1 or XCLKIN.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Bypass	PLL Bypass is the default PLL configuration upon power-up or after an external reset (\overline{XRS}). This mode is selected when the PLLCR register is set to 0x0000 or while the PLL locks to a new frequency after the PLLCR register has been modified. In this mode, the PLL itself is bypassed but the PLL is not turned off.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Enable	Achieved by writing a non-zero value n into the PLLCR register. Upon writing to the PLLCR the device will switch to PLL Bypass mode until the PLL locks.	0, 1 2 3	OSCCLK * n/4 OSCCLK * n/2 OSCCLK * n/1

6.6.4 USB and HRCAP PLL Module (PLL2)

In addition to the main system PLL, these devices also contain a second PLL (PLL2) which can be used to clock the USB and HRCAP peripherals. The PLL supports multipliers of 1 to 15 and has a fixed divide-by-two on its output.

PLL2 may be clocked from the following three sources by modifying the PLL2CLKSRCSEL bits appropriately in the PLL2CTL register:

- INTOSC1 (Internal Zero-pin Oscillator 1): This is the on-chip internal oscillator 1 and provides a 10-MHz clock. If used as a clock source for HRCAP, the oscillator compensation routine should be called frequently. Because of accuracy requirements, INTOSC1 cannot be used as a clock source for the USB.
- Crystal/Resonator Operation: The (crystal) oscillator enables the use of an external crystal or resonator attached to the device to provide the time base. The crystal or resonator is connected to the X1/X2 pins.
- External Clock Source Operation: This mode allows the reference clock to be derived from an external single-ended clock source connected to either GPIO19 or GPIO38. The XCLKINSEL bit in the XCLK register should be set appropriately to enable the selected GPIO to drive XCLKIN.

NOTE

For proper operation of the USB module, PLL2 should be configured to generate a 120-MHz clock. This will be divided by two to yield the desired 60 MHz for the USB peripheral.

HRCAP supports a maximum clock input frequency of 120 MHz.

6.6.5 Loss of Input Clock (NMI Watchdog Function)

The 2806x devices may be clocked from either one of the internal zero-pin oscillators (INTOSC1/INTOSC2), the on-chip crystal oscillator, or from an external clock input. Regardless of the clock source, in PLL-enabled and PLL-bypass mode, if the input clock to the PLL vanishes, the PLL will issue a limp-mode clock at its output. This limp-mode clock continues to clock the CPU and peripherals at a typical frequency of 1–5 MHz.

When the limp mode is activated, a $\overline{\text{CLOCKFAIL}}$ signal is generated that is latched as an NMI interrupt. Depending on how the NMIRESETSEL bit has been configured, a reset to the device can be fired immediately or the NMI watchdog counter can issue a reset when it overflows. In addition to this, the Missing Clock Status (MCLKSTS) bit is set. The NMI interrupt could be used by the application to detect the input clock failure and initiate necessary corrective action such as switching over to an alternative clock source (if available) or initiate a shut-down procedure for the system.

If the software does not respond to the clock-fail condition, the NMI watchdog triggers a reset after a preprogrammed time interval. Figure 6-14 shows the interrupt mechanisms involved.

Figure 6-14. NMI-Watchdog

6.6.6 CPU-Watchdog Module

The CPU-watchdog module on the 2806x device is similar to the one used on the 281x/280x/283xx devices. This module generates an output pulse, 512 oscillator clocks wide (OSCCLK), whenever the 8-bit watchdog up counter has reached its maximum value. To prevent this, the user must disable the counter or the software must periodically write a 0x55 + 0xAA sequence into the watchdog key register that resets the watchdog counter. Figure 6-15 shows the various functional blocks within the watchdog module.

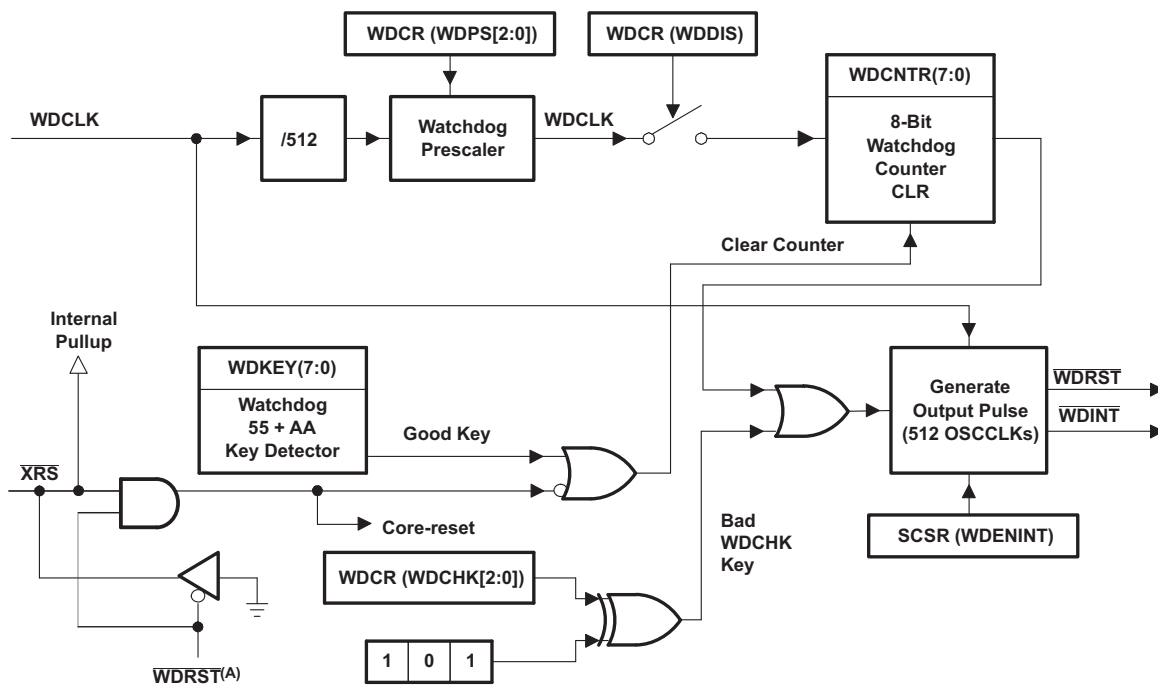

Normally, when the input clocks are present, the CPU-watchdog counter decrements to initiate a CPU-watchdog reset or WDINT interrupt. However, when the external input clock fails, the CPU-watchdog counter stops decrementing (that is, the watchdog counter does not change with the limp-mode clock).

NOTE

The CPU-watchdog is different from the NMI watchdog. The CPU-watchdog is the legacy watchdog that is present in all 28x devices.

NOTE

Applications in which the correct CPU operating frequency is absolutely critical should implement a mechanism by which the MCU will be held in reset, should the input clocks ever fail. For example, an R-C circuit may be used to trigger the $\overline{\text{XRS}}$ pin of the MCU, should the capacitor ever get fully charged. An I/O pin may be used to discharge the capacitor on a periodic basis to prevent it from getting fully charged. Such a circuit would also help in detecting failure of the flash memory.

A. The $\overline{\text{WDRST}}$ signal is driven low for 512 OSCCLK cycles.

Figure 6-15. CPU-Watchdog Module

The $\overline{\text{WDINT}}$ signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the CPU-watchdog. This module will run off OSCCLK. The $\overline{\text{WDINT}}$ signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See Section 6.7 for more details.

In IDLE mode, the $\overline{\text{WDINT}}$ signal can generate an interrupt to the CPU, through the PIE, to take the CPU out of IDLE mode.

In HALT mode, the CPU-watchdog can be used to wake up the device through a device reset.

6.7 Low-power Modes Block

Table 6-16 summarizes the various modes.

Table 6-16. Low-power Modes

MODE	LPMCR0(1:0)	OSCCLK	CLKIN	SYSCLKOUT	EXIT ⁽¹⁾
IDLE	00	On	On	On	\overline{XRS} , CPU-watchdog interrupt, any enabled interrupt
STANDBY	01	On (CPU-watchdog still running)	Off	Off	\overline{XRS} , CPU-watchdog interrupt, GPIO Port A signal, debugger ⁽²⁾
HALT ⁽³⁾	1X	Off (on-chip crystal oscillator and PLL turned off, zero-pin oscillator and CPU-watchdog state dependent on user code.)	Off	Off	\overline{XRS} , GPIO Port A signal, debugger ⁽²⁾ , CPU-watchdog

- (1) The Exit column lists which signals or under what conditions the low power mode is exited. A low signal, on any of the signals, exits the low power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise, the low-power mode will not be exited and the device will go back into the indicated low power mode.
- (2) The JTAG port can still function even if the CPU clock (CLKIN) is turned off.
- (3) The WDCLK must be active for the device to go into HALT mode.

The various low-power modes operate as follows:

- IDLE Mode:** This mode is exited by any enabled interrupt that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.
- STANDBY Mode:** Any GPIO port A signal (GPIO[31:0]) can wake the device from STANDBY mode. The user must select which signals will wake the device in the GPIOLPMSEL register. The selected signals are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register.
- HALT Mode:** CPU-watchdog, \overline{XRS} , and any GPIO port A signal (GPIO[31:0]) can wake the device from HALT mode. The user selects the signal in the GPIOLPMSEL register.

NOTE

The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed. See the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual (SPRUH18)* for more details.

6.8 Interrupts

Figure 6-16 shows how the various interrupt sources are multiplexed.

Figure 6-16. External and PIE Interrupt Sources

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. Table 6-17 shows the interrupts used by 2806x devices.

The TRAP #VectorNumber instruction transfers program control to the interrupt service routine corresponding to the vector specified. TRAP #0 attempts to transfer program control to the address pointed to by the reset vector. The PIE vector table does not, however, include a reset vector. Therefore, TRAP #0 should not be used when the PIE is enabled. Doing so will result in undefined behavior.

When the PIE is enabled, TRAP #1 through TRAP #12 will transfer program control to the interrupt service routine corresponding to the first vector within the PIE group. For example: TRAP #1 fetches the vector from INT1.1, TRAP #2 fetches the vector from INT2.1, and so forth.

Figure 6-17. Multiplexing of Interrupts Using the PIE Block

(1) Out of 96 possible interrupts, some interrupts are not used. These interrupts are reserved for future devices. These interrupts can be used as software interrupts if they are enabled at the PIEIFRx level, provided none of the interrupts within the group is being used by a peripheral. Otherwise, interrupts coming in from peripherals may be lost by accidentally clearing their flag while modifying the PIEIFR. To summarize, there are two safe cases when the reserved interrupts could be used as software interrupts:

- No peripheral within the group is asserting interrupts.
- No peripheral interrupts are assigned to the group (for example, PIE group 7).

6.9 Peripherals

6.9.1 Control Law Accelerator (CLA) Overview

The control law accelerator extends the capabilities of the C28x CPU by adding parallel processing. Time-critical control loops serviced by the CLA can achieve low ADC sample to output delay. Thus, the CLA enables faster system response and higher frequency control loops. Using the CLA for time-critical tasks frees up the main CPU to perform other system and communication functions concurrently. The following is a list of major features of the CLA.

- Clocked at the same rate as the main CPU (SYSCLKOUT).
- An independent architecture allowing CLA algorithm execution independent of the main C28x CPU.
 - Complete bus architecture:
 - Program address bus and program data bus
 - Data address bus, data read bus, and data write bus
 - Independent eight-stage pipeline.
 - 12-bit program counter (MPC)
 - Four 32-bit result registers (MR0–MR3)
 - Two 16-bit auxiliary registers (MAR0, MAR1)
 - Status register (MSTF)
- Instruction set includes:
 - IEEE single-precision (32-bit) floating-point math operations
 - Floating-point math with parallel load or store
 - Floating-point multiply with parallel add or subtract
 - 1/X and 1/sqrt(X) estimations
 - Data type conversions.
 - Conditional branch and call
 - Data load and store operations
- The CLA program code can consist of up to eight tasks or interrupt service routines.
 - The start address of each task is specified by the MVECT registers.
 - No limit on task size as long as the tasks fit within the CLA program memory space.
 - One task is serviced at a time through to completion. There is no nesting of tasks.
 - Upon task completion, a task-specific interrupt is flagged within the PIE.
 - When a task finishes, the next highest-priority pending task is automatically started.
- Task trigger mechanisms:
 - C28x CPU through the IACK instruction
 - Task1 to Task7: the corresponding ADC, ePWM, eQEP, or eCAP module interrupt. For example:
 - Task1: ADCINT1 or EPWM1_INT
 - Task2: ADCINT2 or EPWM2_INT
 - Task4: ADCINT4 or EPWM4_INT or EQEPx_INT or ECAPx_INT
 - Task7: ADCINT7 or EPWM7_INT or EQEPx_INT or ECAPx_INT
 - Task8: ADCINT8 or by CPU Timer 0 or EQEPx_INT or ECAPx_INT.
- Memory and Shared Peripherals:
 - Two dedicated message RAMs for communication between the CLA and the main CPU.
 - The C28x CPU can map CLA program and data memory to the main CPU space or CLA space.
 - The CLA has direct access to the ADC Result registers, comparator registers, and the eCAP, eQEP, and ePWM+HRPWM registers.

(1) All registers in this table are CSM protected

(2) The main C28x CPU has read only access to this register for debug purposes. The main CPU cannot perform CPU or debugger writes to this register.

Table 6-23. CLA Message RAM

ADDRESS RANGE	SIZE (x16)	DESCRIPTION
0x1480 – 0x14FF	128	CLA to CPU Message RAM
0x1500 – 0x157F	128	CPU to CLA Message RAM

6.9.2 Analog Block

A 12-bit ADC core is implemented that has different timings than the 12-bit ADC used on the F280x and F2833x devices. The ADC wrapper is modified to incorporate the new timings and also other enhancements to improve the timing control of start of conversions. Figure 6-20 shows the interaction of the analog module with the rest of the F2806x system.

Figure 6-20. Analog Pin Configurations

6.9.2.1 Analog-to-Digital Converter (ADC)

6.9.2.1.1 Features

The core of the ADC contains a single 12-bit converter fed by two sample-and-hold circuits. The sample-and-hold circuits can be sampled simultaneously or sequentially. These, in turn, are fed by a total of up to 16 analog input channels. The converter can be configured to run with an internal bandgap reference to create true-voltage based conversions or with a pair of external voltage references (V_{REFHI}/V_{REFLO}) to create ratiometric-based conversions.

Contrary to previous ADC types, this ADC is not sequencer-based. The user can easily create a series of conversions from a single trigger. However, the basic principle of operation is centered around the configurations of individual conversions, called SOCs, or Start-Of-Conversions.

Functions of the ADC module include:

- 12-bit ADC core with built-in dual sample-and-hold (S/H)
- Simultaneous sampling or sequential sampling modes
- Full range analog input: 0 V to 3.3 V fixed, or V_{REFHI}/V_{REFLO} ratiometric. The digital value of the input analog voltage is derived by:

- Internal Reference ($V_{REFLO} = V_{SSA}$. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

$$\text{Digital Value} = 0, \quad \text{when input} \leq 0 \text{ V}$$

$$\text{Digital Value} = 4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{3.3} \quad \text{when } 0 \text{ V} < \text{input} < 3.3 \text{ V}$$

$$\text{Digital Value} = 4095, \quad \text{when input} \geq 3.3 \text{ V}$$

- External Reference (V_{REFHI}/V_{REFLO} connected to external references. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

$$\text{Digital Value} = 0, \quad \text{when input} \leq 0 \text{ V}$$

$$\text{Digital Value} = 4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{V_{REFHI} - V_{REFLO}} \quad \text{when } 0 \text{ V} < \text{input} < V_{REFHI}$$

$$\text{Digital Value} = 4095, \quad \text{when input} \geq V_{REFHI}$$

- Up to 16-channel, multiplexed inputs
- 16 SOCs, configurable for trigger, sample window, and channel
- 16 result registers (individually addressable) to store conversion values
- Multiple trigger sources
 - S/W – software immediate start
 - ePWM 1–8
 - GPIO XINT2
 - CPU Timer 0, CPU Timer 1, CPU Timer 2
 - ADCINT1, ADCINT2
- 9 flexible PIE interrupts, can configure interrupt request after any conversion

Table 6-25. ADC Result Registers (Mapped to PF0)

REGISTER NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
ADCRESULT0 to ADCRESULT15	0xB00 – 0xB0F	1	No	ADC Result 0 Register to ADC Result 15 Register

Figure 6-21. ADC Connections

ADC Connections if the ADC is Not Used

It is recommended that the connections for the analog power pins be kept, even if the ADC is not used. Following is a summary of how the ADC pins should be connected, if the ADC is not used in an application:

- V_{DDA} – Connect to V_{DDIO}
- V_{SSA} – Connect to V_{SS}
- V_{REFLO} – Connect to V_{SS}
- $ADCINAn, ADCINBn, V_{REFHI}$ – Connect to V_{SSA}

When the ADC module is used in an application, unused ADC input pins should be connected to analog ground (V_{SSA}).

NOTE: Unused ADCIN pins that are multiplexed with AIO function should not be directly connected to analog ground. They should be grounded through a 1-k Ω resistor. This is to prevent an errant code from configuring these pins as AIO outputs and driving grounded pins to a logic-high state.

When the ADC is not used, be sure that the clock to the ADC module is not turned on to realize power savings.

6.9.2.1.2 ADC Start-of-Conversion Electrical Data/Timing

Table 6-26. External ADC Start-of-Conversion Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	MIN	MAX	UNIT
$t_{w(ADCSOCL)}$ Pulse duration, $\overline{ADCSOCxO}$ low	$32t_{c(HCO)}$		cycles

Figure 6-22. $\overline{ADCSOCAO}$ or $\overline{ADCSOCBO}$ Timing

6.9.2.1.3 On-Chip Analog-to-Digital Converter (ADC) Electrical Data/Timing

Table 6-27. ADC Electrical Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
DC SPECIFICATIONS				
Resolution	12			Bits
ADC clock	90-MHz device	0.001	45	MHz
Sample Window	7		64	ADC Clocks
ACCURACY				
INL (Integral nonlinearity) ⁽¹⁾	-4		4	LSB
DNL (Differential nonlinearity), no missing codes	-1		1.5	LSB
Offset error ⁽²⁾	Executing a single self-recalibration ⁽³⁾	-20	20	LSB
	Executing periodic self-recalibration ⁽⁴⁾	-4	4	
Overall gain error with internal reference	-60		60	LSB
Overall gain error with external reference	-40		40	LSB
Channel-to-channel offset variation	-4		4	LSB
Channel-to-channel gain variation	-4		4	LSB
ADC temperature coefficient with internal reference		-50		ppm/°C
ADC temperature coefficient with external reference		-20		ppm/°C
V_{REFLO}		-100		μ A
V_{REFHI}		100		μ A
ANALOG INPUT				
Analog input voltage with internal reference	0		3.3	V
Analog input voltage with external reference	V_{REFLO}		V_{REFHI}	V
V_{REFLO} input voltage ⁽⁵⁾	V_{SSA}		0.66	V
V_{REFHI} input voltage ⁽⁶⁾		2.64	V_{DDA}	V
	with $V_{REFLO} = V_{SSA}$	1.98	V_{DDA}	
Input capacitance		5		pF
Input leakage current		± 2		μ A

- (1) INL will degrade when the ADC input voltage goes above V_{DDA} .
- (2) 1 LSB has the weighted value of full-scale range (FSR)/4096. FSR is 3.3 V with internal reference and $V_{REFHI} - V_{REFLO}$ for external reference.
- (3) For more details, see the *TMS320F28069, TMS320F28068, TMS320F28067, TMS320F28066, TMS320F28065, TMS320F28064, TMS320F28063, TMS320F28062 Piccolo MCUs Silicon Errata (SPRZ342)*.
- (4) Periodic self-recalibration will remove system-level and temperature dependencies on the ADC zero offset error.
- (5) V_{REFLO} is always connected to V_{SSA} on the 80-pin PN and PFP devices.
- (6) V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes. Since V_{REFHI} is tied to ADCINA0 on the 80-pin PN and PFP devices, the input signal on ADCINA0 must not exceed V_{DDA} .

Table 6-28. ADC Power Modes

ADC OPERATING MODE	CONDITIONS	I _{DDA}	UNIT
Mode A – Operating Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWDN = 1)	16	mA
Mode B – Quick Wake Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWDN = 0)	4	mA
Mode C – Comparator-Only Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWDN = 0)	1.5	mA
Mode D – Off Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 0) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWDN = 0)	0.075	mA

6.9.2.1.3.1 Internal Temperature Sensor

Table 6-29. Temperature Sensor Coefficient

PARAMETER ⁽¹⁾	MIN	TYP	MAX	UNIT
T _{SLOPE} Degrees C of temperature movement per measured ADC LSB change of the temperature sensor		0.18 ⁽²⁾⁽³⁾		°C/LSB
T _{OFFSET} ADC output at 0°C of the temperature sensor		1750		LSB

- (1) The temperature sensor slope and offset are given in terms of ADC LSBs using the internal reference of the ADC. Values must be adjusted accordingly in external reference mode to the external reference voltage.
- (2) ADC temperature coefficient is accounted for in this specification
- (3) Output of the temperature sensor (in terms of LSBs) is sign-consistent with the direction of the temperature movement. Increasing temperatures will give increasing ADC values relative to an initial value; decreasing temperatures will give decreasing ADC values relative to an initial value.

6.9.2.1.3.2 ADC Power-Up Control Bit Timing

Table 6-30. ADC Power-Up Delays

PARAMETER ⁽¹⁾	MIN	MAX	UNIT
t _{d(PWD)} Delay time for the ADC to be stable after power up		1	ms

- (1) Timings maintain compatibility to the ADC module. The 2806x ADC supports driving all 3 bits at the same time t_{d(PWD)} ms before first conversion.

Figure 6-23. ADC Conversion Timing

Typical Values of the Input Circuit Components:

Switch Resistance (R_{on}): 3.4 kΩ

Sampling Capacitor (C_h): 1.6 pF

Parasitic Capacitance (C_p): 5 pF

Source Resistance (R_s): 50 Ω

Figure 6-24. ADC Input Impedance Model

6.9.2.1.3.3 ADC Sequential and Simultaneous Timings

Figure 6-25. Timing Example for Sequential Mode / Late Interrupt Pulse

Figure 6-26. Timing Example for Sequential Mode / Early Interrupt Pulse

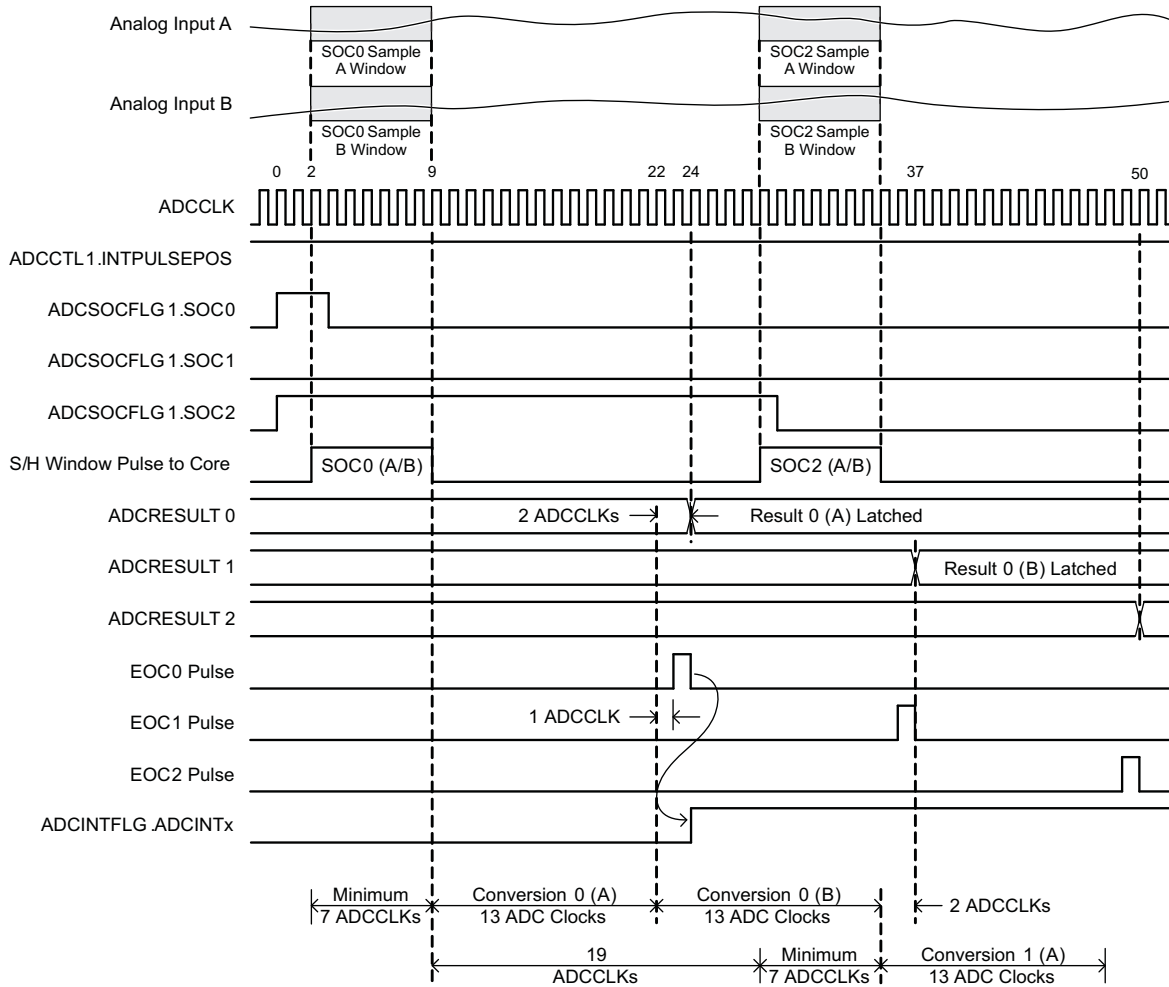

Figure 6-27. Timing Example for Simultaneous Mode / Late Interrupt Pulse

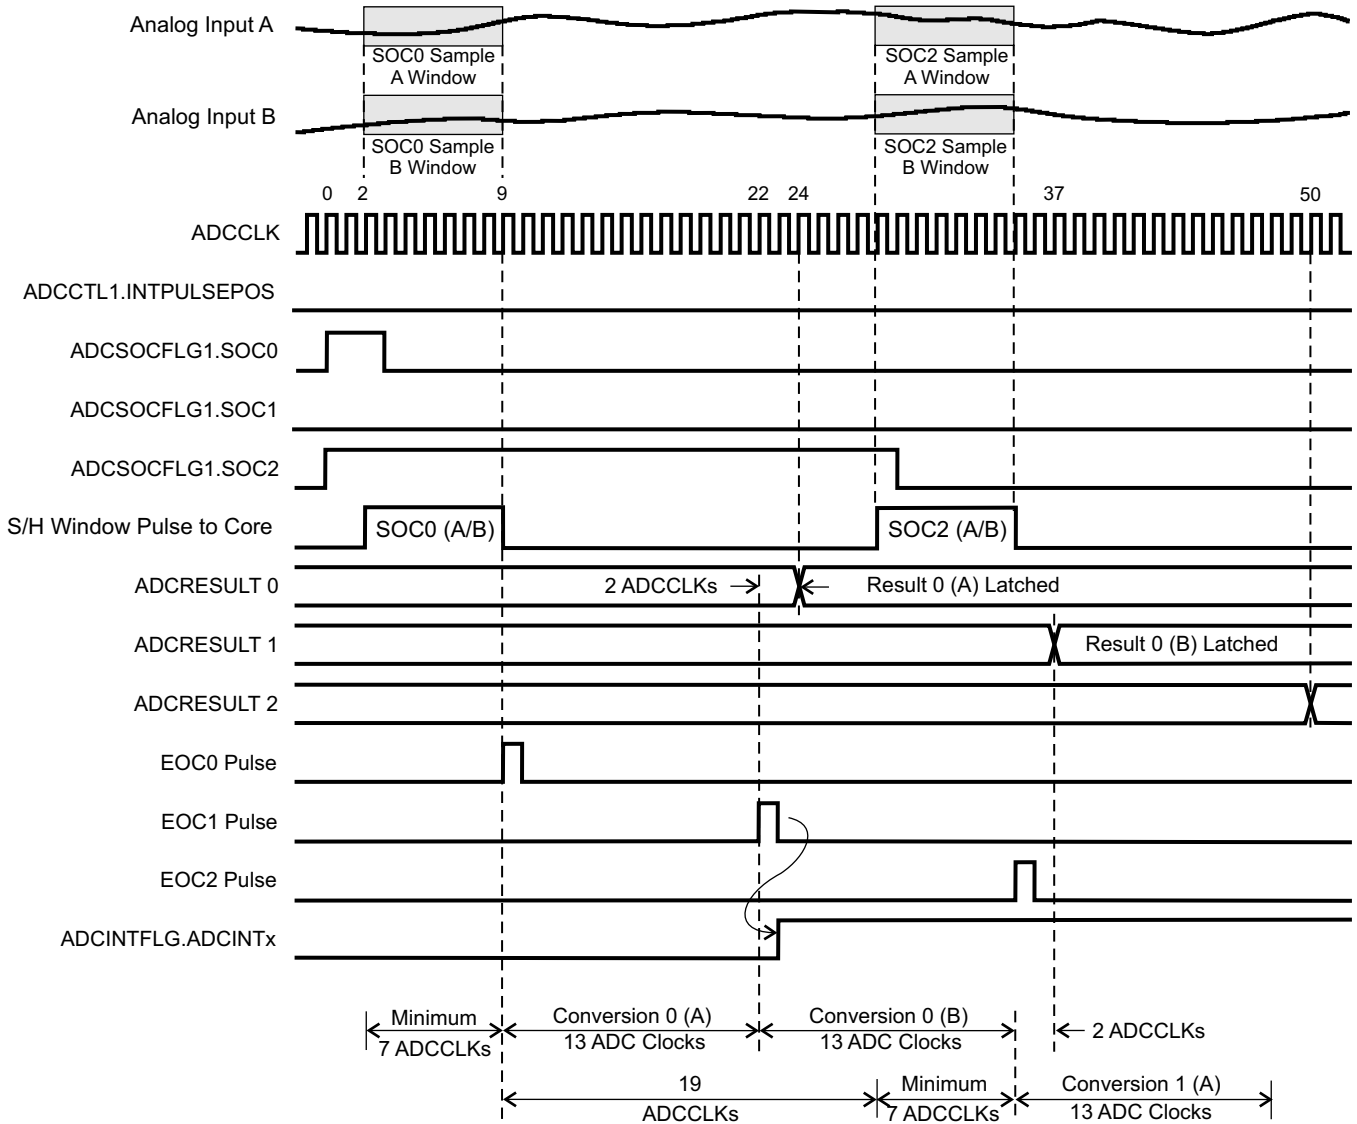

Figure 6-28. Timing Example for Simultaneous Mode / Early Interrupt Pulse

6.9.2.2 ADC MUX

Figure 6-29. AIOx Pin Multiplexing

The ADC channel and Comparator functions are always available. The digital I/O function is available only when the respective bit in the AIOMUX1 register is 0. In this mode, reading the AIODAT register reflects the actual pin state.

The digital I/O function is disabled when the respective bit in the AIOMUX1 register is 1. In this mode, reading the AIODAT register reflects the output latch of the AIODAT register and the input digital I/O buffer is disabled to prevent analog signals from generating noise.

On reset, the digital function is disabled. If the pin is used as an analog input, users should keep the AIO function disabled for that pin.

6.9.2.3 Comparator Block

Figure 6-30 shows the interaction of the Comparator modules with the rest of the system.

Figure 6-30. Comparator Block Diagram

Table 6-31. Comparator Control Registers

REGISTER NAME	COMP1 ADDRESS	COMP2 ADDRESS	COMP3 ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
COMPCTL	0x6400	0x6420	0x6440	1	Yes	Comparator Control Register
COMPSTS	0x6402	0x6422	0x6442	1	No	Comparator Status Register
DACCTL	0x6404	0x6424	0x6444	1	Yes	DAC Control Register
DACVAL	0x6406	0x6426	0x6446	1	No	DAC Value Register
RAMPMAXREF_ACTIVE	0x6408	0x6428	0x6448	1	No	Ramp Generator Maximum Reference (Active) Register
RAMPMAXREF_SHDW	0x640A	0x642A	0x644A	1	No	Ramp Generator Maximum Reference (Shadow) Register
RAMPDECVAL_ACTIVE	0x640C	0x642C	0x644C	1	No	Ramp Generator Decrement Value (Active) Register
RAMPDECVAL_SHDW	0x640E	0x642E	0x644E	1	No	Ramp Generator Decrement Value (Shadow) Register
RAMPSTS	0x6410	0x6430	0x6450	1	No	Ramp Generator Status Register

6.9.2.3.1 On-Chip Comparator/DAC Electrical Data/Timing

Table 6-32. Electrical Characteristics of the Comparator/DAC

CHARACTERISTIC	MIN	TYP	MAX	UNIT
Comparator				
Comparator Input Range		$V_{SSA} - V_{DDA}$		V
Comparator response time to PWM Trip Zone (Async)		30		ns
Input Offset		±5		mV
Input Hysteresis ⁽¹⁾		35		mV
DAC				
DAC Output Range		$V_{SSA} - V_{DDA}$		V
DAC resolution		10		bits
DAC settling time		See Figure 6-31		
DAC Gain		-1.5%		
DAC Offset		10		mV
Monotonic		Yes		
INL		±3		LSB

(1) Hysteresis on the comparator inputs is achieved with a Schmidt trigger configuration. This results in an effective 100-kΩ feedback resistance between the output of the comparator and the non-inverting input of the comparator.

Figure 6-31. DAC Settling Time

6.9.3 Detailed Descriptions

Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs one-half LSB before the first code transition. The full-scale point is defined as level one-half LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ± 1 LSB ensures no missing codes.

Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

Gain Error

The first code transition should occur at an analog value one-half LSB above negative full scale. The last transition should occur at an analog value one and one-half LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding DC. The value for SINAD is expressed in decibels.

Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,
$$N = \frac{(\text{SINAD} - 1.76)}{6.02}$$
 it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first nine harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

6.9.4 Serial Peripheral Interface (SPI) Module

The device includes the four-pin serial peripheral interface (SPI) module. Up to two SPI modules are available. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (1 to 16 bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
 - SPISOMI: SPI slave-output/master-input pin
 - SPISIMO: SPI slave-input/master-output pin
 - $\overline{\text{SPISTE}}$: SPI slave transmit-enable pin
 - SPICLK: SPI serial-clock pin

NOTE: All four pins can be used as GPIO if the SPI module is not used.

- Two operational modes: master and slave
- Baud rate: 125 different programmable rates.

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)} \quad \text{when SPIBRR} = 3 \text{ to } 127$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{4} \quad \text{when SPIBRR} = 0, 1, 2$$

- Data word length: 1 to 16 data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
 - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: Located in control register frame beginning at address 7040h.

NOTE

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced feature:

- 4-level transmit/receive FIFO
- Delayed transmit control
- Bi-directional 3 wire SPI mode support
- Audio data receive support through $\overline{\text{SPISTE}}$ inversion

The SPI port operation is configured and controlled by the registers listed in [Table 6-33](#) and [Table 6-34](#).

Table 6-33. SPI-A Registers

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION ⁽¹⁾
SPICCR	0x7040	1	No	SPI-A Configuration Control Register
SPICTL	0x7041	1	No	SPI-A Operation Control Register
SPISTS	0x7042	1	No	SPI-A Status Register
SPIBRR	0x7044	1	No	SPI-A Baud Rate Register
SPIRXEMU	0x7046	1	No	SPI-A Receive Emulation Buffer Register
SPIRXBUF	0x7047	1	No	SPI-A Serial Input Buffer Register
SPITXBUF	0x7048	1	No	SPI-A Serial Output Buffer Register
SPIDAT	0x7049	1	No	SPI-A Serial Data Register
SPIFFTX	0x704A	1	No	SPI-A FIFO Transmit Register
SPIFFRX	0x704B	1	No	SPI-A FIFO Receive Register
SPIFFCT	0x704C	1	No	SPI-A FIFO Control Register
SPIPRI	0x704F	1	No	SPI-A Priority Control Register

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Table 6-34. SPI-B Registers

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION ⁽¹⁾
SPICCR	0x7740	1	No	SPI-B Configuration Control Register
SPICTL	0x7741	1	No	SPI-B Operation Control Register
SPISTS	0x7742	1	No	SPI-B Status Register
SPIBRR	0x7744	1	No	SPI-B Baud Rate Register
SPIRXEMU	0x7746	1	No	SPI-B Receive Emulation Buffer Register
SPIRXBUF	0x7747	1	No	SPI-B Serial Input Buffer Register
SPITXBUF	0x7748	1	No	SPI-B Serial Output Buffer Register
SPIDAT	0x7749	1	No	SPI-B Serial Data Register
SPIFFTX	0x774A	1	No	SPI-B FIFO Transmit Register
SPIFFRX	0x774B	1	No	SPI-B FIFO Receive Register
SPIFFCT	0x774C	1	No	SPI-B FIFO Control Register
SPIPRI	0x774F	1	No	SPI-B Priority Control Register

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Figure 6-32 is a block diagram of the SPI in slave mode.

A. $\overline{\text{SPISTE}}$ is driven low by the master for a slave device.

Figure 6-32. SPI Module Block Diagram (Slave Mode)

6.9.4.1 SPI Master Mode Electrical Data/Timing

Table 6-35 lists the master mode timing (clock phase = 0) and Table 6-36 lists the master mode timing (clock phase = 1). Figure 6-33 and Figure 6-34 show the timing waveforms.

Table 6-35. SPI Master Mode External Timing (Clock Phase = 0)⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

	$t_{w(SPCL)S}$	Pulse duration, SPICLK low (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	
14	$t_{w(SPCL)S}$	Pulse duration, SPICLK low (clock polarity = 0)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	ns
	$t_{w(SPCH)S}$	Pulse duration, SPICLK high (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	
17	$t_{su(SOMI-SPCH)S}$	Setup time, SPISOMI before SPICLK high (clock polarity = 0)	$0.125t_{c(SPC)S}$		ns
	$t_{su(SOMI-SPCL)S}$	Setup time, SPISOMI before SPICLK low (clock polarity = 1)	$0.125t_{c(SPC)S}$		
18	$t_{v(SPCL-SOMI)S}$	Valid time, SPISOMI data valid after SPICLK low (clock polarity = 1)	$0.75t_{c(SPC)S}$		ns
	$t_{v(SPCH-SOMI)S}$	Valid time, SPISOMI data valid after SPICLK high (clock polarity = 0)	$0.75t_{c(SPC)S}$		
21	$t_{su(SIMO-SPCH)S}$	Setup time, SPISIMO before SPICLK high (clock polarity = 0)	26		ns
	$t_{su(SIMO-SPCL)S}$	Setup time, SPISIMO before SPICLK low (clock polarity = 1)	26		
22	$t_{v(SPCH-SIMO)S}$	Valid time, SPISIMO data valid after SPICLK high (clock polarity = 0)	$0.5t_{c(SPC)S} - 10$		ns
	$t_{v(SPCL-SIMO)S}$	Valid time, SPISIMO data valid after SPICLK low (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$		

- (1) The MASTER/SLAVE bit (SPICTL.2) is cleared and the CLOCK PHASE bit (SPICTL.3) is cleared.
- (2) $t_{c(SPC)} = \text{SPI clock cycle time} = \text{LSPCLK}/4$ or $\text{LSPCLK}/(\text{SPIBRR} + 1)$
- (3) $t_{c(LCO)} = \text{LSPCLK cycle time}$
- (4) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate:
Master mode transmit 20-MHz MAX, master mode receive 10-MHz MAX
Slave mode transmit 10-MHz MAX, slave mode receive 10-MHz MAX.
- (5) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

- A. In the slave mode, the $\overline{\text{SPISTE}}$ signal should be asserted low at least $0.5t_{c(SPC)}$ before the valid SPI clock edge and remain low for at least $0.5t_{c(SPC)}$ after the receiving edge (SPICLK) of the last data bit.

Figure 6-36. SPI Slave Mode External Timing (Clock Phase = 1)

6.9.5 Serial Communications Interface (SCI) Module

The devices include two serial communications interface (SCI) modules (SCI-A, SCI-B). The SCI module supports digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
 - SCITXD: SCI transmit-output pin
 - SCIRXD: SCI receive-input pin
- NOTE:** Both pins can be used as GPIO if not used for SCI.
- Baud rate programmable to 64K different rates:

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{BRR} + 1) * 8} \quad \text{when BRR} \neq 0$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{16} \quad \text{when BRR} = 0$$

- Data-word format
 - One start bit
 - Data-word length programmable from 1 to 8 bits
 - Optional even/odd/no parity bit
 - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
 - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
 - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- NRZ (non-return-to-zero) format

NOTE

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced features:

- Auto baud-detect hardware logic
- 4-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in [Table 6-39](#) and [Table 6-40](#).

Table 6-39. SCI-A Registers⁽¹⁾

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
SCICCRA	0x7050	1	No	SCI-A Communications Control Register
SCICTL1A	0x7051	1	No	SCI-A Control Register 1
SCIHBAUDA	0x7052	1	No	SCI-A Baud Register, High Bits
SCILBAUDA	0x7053	1	No	SCI-A Baud Register, Low Bits
SCICTL2A	0x7054	1	No	SCI-A Control Register 2

(1) Registers in this table are mapped to Peripheral Frame 2 space. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

(2) These registers are new registers for the FIFO mode.

Figure 6-37 shows the SCI module block diagram.

Figure 6-37. Serial Communications Interface (SCI) Module Block Diagram

6.9.6 Multichannel Buffered Serial Port (McBSP) Module

The McBSP module has the following features:

- Compatible to McBSP in TMS320C28x/TMS320F28x DSP devices
- Full-duplex communication
- Double-buffered data registers that allow a continuous data stream
- Independent framing and clocking for receive and transmit
- External shift clock generation or an internal programmable frequency shift clock
- A wide selection of data sizes including 8-, 12-, 16-, 20-, 24-, or 32-bits
- 8-bit data transfers with LSB or MSB first
- Programmable polarity for both frame synchronization and data clocks
- Highly programmable internal clock and frame generation
- Direct interface to industry-standard CODECs, Analog Interface Chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- Works with SPI-compatible devices
- The following application interfaces can be supported on the McBSP:
 - T1/E1 framers
 - IOM-2 compliant devices
 - AC97-compliant devices (the necessary multiphase frame synchronization capability is provided.)
 - IIS-compliant devices
 - SPI
- McBSP clock rate,

$$\text{CLKG} = \frac{\text{CLKSRG}}{(1 + \text{CLKGDV})}$$

where CLKSRG source could be LSPCLK, CLKX, or CLKR. Serial port performance is limited by I/O buffer switching speed. Internal prescalers must be adjusted such that the peripheral speed is less than the I/O buffer speed limit.

NOTE

See [Section 6.9](#) for maximum I/O pin toggling speed.

NOTE

On the 80-pin package, only the clock-stop mode (SPI) of the McBSP is supported.

Figure 6-38 shows the block diagram of the McBSP module.

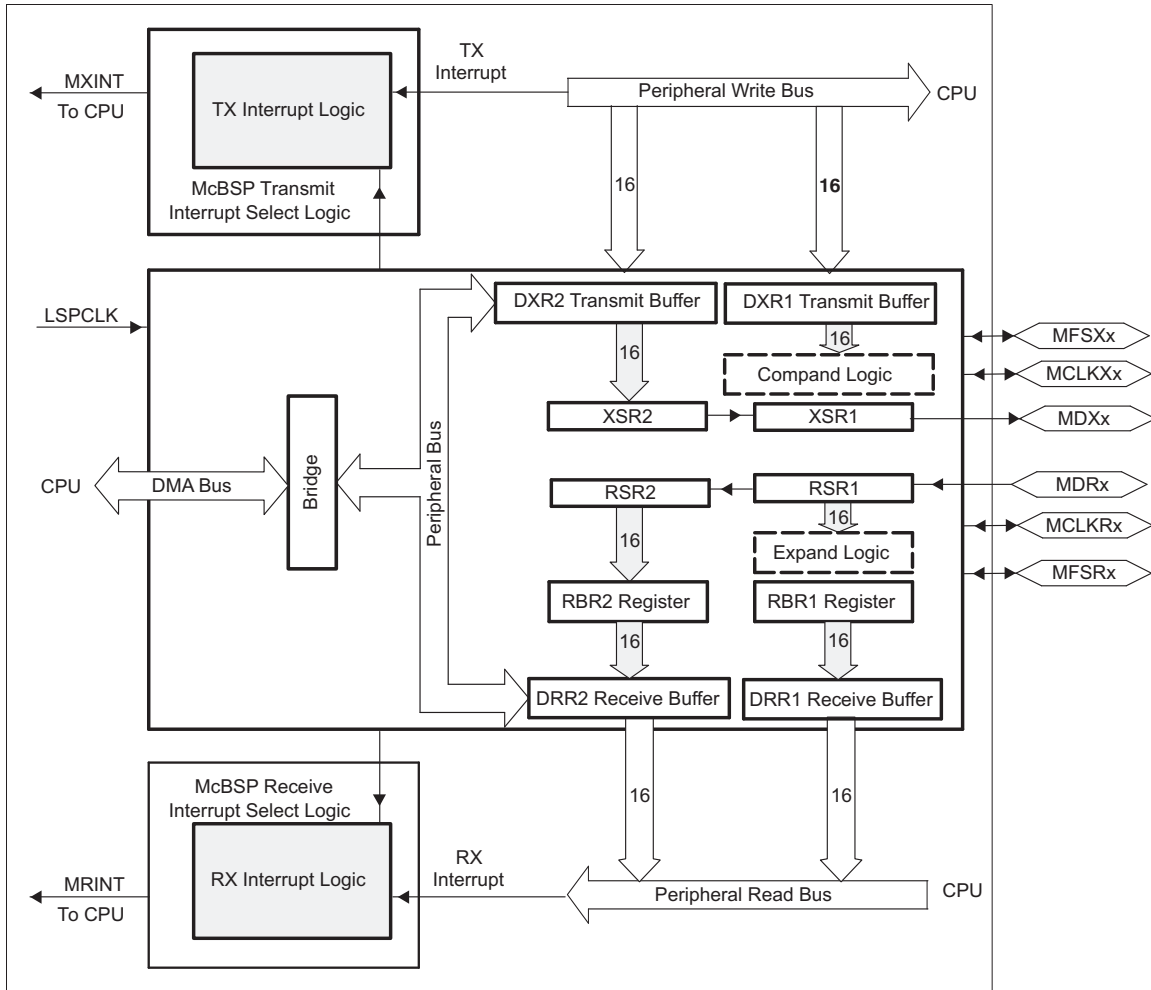

Figure 6-38. McBSP Module

Table 6-41 provides a summary of the McBSP registers.

Table 6-41. McBSP Register Summary

NAME	McBSP-A ADDRESS	TYPE	RESET VALUE	DESCRIPTION

6.9.6.1 McBSP Electrical Data/Timing

6.9.6.1.1 McBSP Transmit and Receive Timing

Table 6-42. McBSP Timing Requirements⁽¹⁾⁽²⁾

NO.			MIN	MAX	UNIT
	McBSP module clock (CLKG, CLKX, CLKR) range		1		kHz
				20 ⁽³⁾⁽⁴⁾	
	McBSP module cycle time (CLKG, CLKX, CLKR) range		50 ⁽⁴⁾		ns
				1	ms
M11	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P	ns
M12	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P – 7	ns
M13	$t_{r(CKRX)}$	Rise time, CLKR/X	CLKR/X ext		7 ns
M14	$t_{f(CKRX)}$	Fall time, CLKR/X	CLKR/X ext		7 ns
M15	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	18	ns
			CLKR ext	2	
M16	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	0	ns
			CLKR ext	6	
M17	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	18	ns
			CLKR ext	2	
M18	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	0	ns
			CLKR ext	6	
M19	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	18	ns
			CLKX ext	2	
M20	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	0	ns
			CLKX ext	6	

- (1) Polarity bits CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) $2P = 1/CLKG$ in ns. CLKG is the output of sample rate generator mux. $CLKG = CLKSRG/(1 + CLKGDV)$. CLKSRG can be LSPCLK, CLKX, CLKR as source. $CLKSRG \leq (SYSCLKOUT/2)$. McBSP performance is limited by I/O buffer switching speed.
- (3) Internal clock prescalers must be adjusted such that the McBSP clock (CLKG, CLKX, CLKR) speeds are not greater than the I/O buffer speed limit (20 MHz).
- (4) Maximum McBSP module clock frequency decreases to 10 MHz for internal CLKR.

6.9.7 Enhanced Controller Area Network (eCAN) Module

The CAN module (eCAN-A) has the following features:

- Fully compliant with CAN protocol, version 2.0B
- Supports data rates up to 1 Mbps
- Thirty-two mailboxes, each with the following properties:
 - Configurable as receive or transmit
 - Configurable with standard or extended identifier
 - Has a programmable receive mask
 - Supports data and remote frame
 - Composed of 0 to 8 bytes of data
 - Uses a 32-bit time stamp on receive and transmit message
 - Protects against reception of new message
 - Holds the dynamically programmable priority of transmit message
 - Employs a programmable interrupt scheme with two interrupt levels
 - Employs a programmable alarm on transmission or reception time-out
- Low-power mode
- Programmable wake-up on bus activity
- Automatic reply to a remote request message
- Automatic retransmission of a frame in case of loss of arbitration or error
- 32-bit local network time counter synchronized by a specific message (communication in conjunction with mailbox 16)
- Self-test mode
 - Operates in a loopback mode receiving its own message. A "dummy" acknowledge is provided, thereby eliminating the need for another node to provide the acknowledge bit.

NOTE

For a SYSCLKOUT of 90 MHz, the smallest bit rate possible is 6.25 kbps.

The F2806x CAN has passed the conformance test per ISO/DIS 16845. Contact TI for test report and exceptions.

Figure 6-46. eCAN-A Memory Map

NOTE

If the eCAN module is not used in an application, the RAM available (LAM, MOTS, MOTO, and mailbox RAM) can be used as general-purpose RAM. The CAN module clock should be enabled for this.

The CAN registers listed in [Table 6-53](#) are used by the CPU to configure and control the CAN controller and the message objects. eCAN control registers only support 32-bit read/write operations. Mailbox RAM can be accessed as 16 bits or 32 bits. All 32-bit accesses are aligned to an even boundary.

Table 6-53. CAN Registers⁽¹⁾

REGISTER NAME	eCAN-A ADDRESS	SIZE (x32)	DESCRIPTION
CANME	0x6000	1	Mailbox enable
CANMD	0x6002	1	Mailbox direction
CANTRS	0x6004	1	Transmit request set

CANGIF1	0x6022	1	Global interrupt flag 1
CANMIM	0x6024	1	Mailbox interrupt mask
CANMIL	0x6026	1	Mailbox interrupt level
CANOPC	0x6028	1	Overwrite protection control
CANTIOC	0x602A	1	TX I/O control
CANRIOC	0x602C	1	RX I/O control
CANTSC	0x602E	1	Time stamp counter (Reserved in SCC mode)
CANTOC	0x6030	1	Time-out control (Reserved in SCC mode)
CANTOS	0x6032	1	Time-out status (Reserved in SCC mode)

(1) These registers are mapped to Peripheral Frame 1.

6.9.8 Inter-Integrated Circuit (I²C)

The device contains one I²C Serial Port. [Figure 6-47](#) shows how the I²C peripheral module interfaces within the device.

The I²C module has the following features:

- Compliance with the Philips Semiconductors I²C-bus specification (version 2.1):
 - Support for 1-bit to 8-bit format transfers
 - 7-bit and 10-bit addressing modes
 - General call
 - START byte mode
 - Support for multiple master-transmitters and slave-receivers
 - Support for multiple slave-transmitters and master-receivers
 - Combined master transmit/receive and receive/transmit mode
 - Data transfer rate of from 10 kbps up to 400 kbps (I²C Fast-mode rate)
- One 4-word receive FIFO and one 4-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
 - Transmit-data ready
 - Receive-data ready
 - Register-access ready
 - No-acknowledgment received
 - Arbitration lost
 - Stop condition detected
 - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable/disable capability
- Free data format mode

- The I²C registers are accessed at the SYSCLKOUT rate. The internal timing and signal waveforms of the I²C port are also at the SYSCLKOUT rate.
- The clock enable bit (I2CAENCLK) in the PCLKCRO register turns off the clock to the I²C port for low power operation. Upon reset, I2CAENCLK is clear, which indicates the peripheral internal clocks are off.

Figure 6-47. I²C Peripheral Module Interfaces

The registers in [Table 6-54](#) configure and control the I²C port operation.

Table 6-54. I2C-A Registers

NAME	ADDRESS	EALLOW PROTECTED	DESCRIPTION

I _i	Input current with an input voltage between 0.1 V _{DDIO} and 0.9 V _{DDIO} MAX		-10	10	μA

6.9.9 Enhanced Pulse Width Modulator (ePWM) Modules (ePWM1–ePWM8)

The devices contain up to eight enhanced PWM (ePWM) modules. Figure 6-48 shows a block diagram of multiple ePWM modules. Figure 6-49 shows the signal interconnections with the ePWM.

Table 6-56 and Table 6-57 show the complete ePWM register set per module.

A. This signal exists only on devices with an eQEP1 module.

- These events are generated by the Type 1 ePWM digital compare (DC) submodule based on the levels of the COMPxOUT and TZ signals.
- This signal exists only on devices with an eQEP1 module.

Figure 6-49. ePWM Submodules Showing Critical Internal Signal Interconnections

6.9.9.1 ePWM Electrical Data/Timing

PWM refers to PWM outputs on ePWM1–8. Table 6-58 shows the PWM timing requirements and Table 6-59, switching characteristics.

Table 6-58. ePWM Timing Requirements⁽¹⁾

		MIN	MAX	UNIT
$t_{w(SYCIN)}$	Sync input pulse width	Asynchronous	$2t_{c(SCO)}$	cycles
		Synchronous	$2t_{c(SCO)}$	cycles
		With input qualifier	$1t_{c(SCO)} + t_{w(IQSW)}$	cycles

(1) For an explanation of the input qualifier parameters, see Table 6-76.

Table 6-59. ePWM Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(PWM)}$	Pulse duration, PWMx output high/low	33.33		ns
$t_{w(SYNCOU)}$	Sync output pulse width	$8t_{c(SCO)}$		cycles
$t_{d(PWM)tza}$	Delay time, trip input active to PWM forced high		25	ns
	Delay time, trip input active to PWM forced low	no pin load		
$t_{d(TZ-PWM)HZ}$	Delay time, trip input active to PWM Hi-Z		20	ns

6.9.9.2 Trip-Zone Input Timing

Table 6-60. Trip-Zone Input Timing Requirements⁽¹⁾

		MIN	MAX	UNIT
$t_{w(TZ)}$	Pulse duration, \overline{TZx} input low	Asynchronous	$2t_{c(TBCLK)}$	cycles
		Synchronous	$2t_{c(TBCLK)}$	cycles
		With input qualifier	$2t_{c(TBCLK)} + t_{w(IQSW)}$	cycles

(1) For an explanation of the input qualifier parameters, see Table 6-76.

- A. $\overline{TZ} - \overline{TZ1}, \overline{TZ2}, \overline{TZ3}, \overline{TZ4}, \overline{TZ5}, \overline{TZ6}$
- B. PWM refers to all the PWM pins in the device. The state of the PWM pins after \overline{TZ} is taken high depends on the PWM recovery software.

Figure 6-50. PWM Hi-Z Characteristics

6.9.10 High-Resolution PWM (HRPWM)

This module combines multiple delay lines in a single module and a simplified calibration system by using a dedicated calibration delay line. For each ePWM module there is one HR delay line.

The HRPWM module offers PWM resolution (time granularity) that is significantly better than what can be achieved using conventionally derived digital PWM methods. The key points for the HRPWM module are:

- Significantly extends the time resolution capabilities of conventionally derived digital PWM
- This capability can be used in both single edge (duty cycle and phase-shift control) as well as dual edge control for frequency/period modulation.
- Finer time granularity control or edge positioning is controlled through extensions to the Compare A and Phase registers of the ePWM module.
- HRPWM capabilities, when available on a particular device, are offered only on the A signal path of an ePWM module (that is, on the EPWMxA output). EPWMxB output has conventional PWM capabilities.

NOTE

The minimum SYSCLKOUT frequency allowed for HRPWM is 60 MHz.

NOTE

When dual-edge high-resolution is enabled (high-resolution period mode), the PWMxB channel will have $\pm 1-2$ TBCLK cycles of jitter on the output.

6.9.10.1 HRPWM Electrical Data/Timing

[Table 6-61](#) shows the high-resolution PWM switching characteristics.

Table 6-61. High-Resolution PWM Characteristics⁽¹⁾

PARAMETER	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size ⁽²⁾		150	310	ps

(1) The HRPWM operates at a minimum SYSCLKOUT frequency of 60 MHz.

(2) Maximum MEP step size is based on worst-case process, maximum temperature and minimum voltage. MEP step size will increase with low voltage and high temperature and decrease with voltage and cold temperature. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.

6.9.11 Enhanced Capture Module (eCAP1)

The device contains an enhanced capture (eCAP) module. Figure 6-51 shows a functional block diagram of a module.

Figure 6-51. eCAP Functional Block Diagram

The eCAP module is clocked at the SYSCLKOUT rate.

The clock enable bits (ECAP1 ENCLK) in the PCLKCR1 register turn off the eCAP module individually (for low-power operation). Upon reset, ECAP1ENCLK is set to low, indicating that the peripheral clock is off.

Table 6-62. eCAP Control and Status Registers

6.9.11.1 eCAP Electrical Data/Timing

[Table 6-63](#) shows the eCAP timing requirement and [Table 6-64](#) shows the eCAP switching characteristics.

Table 6-63. Enhanced Capture (eCAP) Timing Requirement⁽¹⁾

		MIN	MAX	UNIT
$t_{w(CAP)}$	Capture input pulse width	Asynchronous	$2t_{c(SCO)}$	cycles
		Synchronous	$2t_{c(SCO)}$	
		With input qualifier	$1t_{c(SCO)} + t_w(IQSW)$	

(1) For an explanation of the input qualifier parameters, see [Table 6-76](#).

Table 6-64. eCAP Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	MIN	MAX	UNIT
$t_{w(APWM)}$ Pulse duration, APWMx output high/low	20		ns

6.9.12 High-Resolution Capture Modules (HRCAP1–HRCAP4)

The device contains up to four high-resolution capture (HRCAP) modules. The High-Resolution Capture (HRCAP) module measures the difference between external pulses with a typical resolution of 300 ps.

Uses for the HRCAP include:

- Capacitive touch applications
- High-resolution period and duty cycle measurements of pulse train cycles
- Instantaneous speed measurements
- Instantaneous frequency measurements
- Voltage measurements across an isolation boundary
- Distance measurement (sonar) and scanning

The HRCAP module features include:

- Pulse width capture in either non-high-resolution or high-resolution modes
- Difference (Delta) mode pulse width capture
- Typical high-resolution capture on the order of 300 ps resolution on each edge
- Interrupt on either falling or rising edge
- Continuous mode capture of pulse widths in 2-deep buffer
- Calibration logic for precision high-resolution capture
- All of the above resources are dedicated to a single input pin
- HRCAP calibration software library supplied by TI is used for both calibration and calculating fractional pulse widths

The HRCAP module includes one capture channel in addition to a high-resolution calibration block, which connects internally to the last available ePWMxA HRPWM channel when calibrating (that is, if there are eight ePWMs with HRPWM capability, it will be HRPWM8A).

Each HRCAP channel has the following independent key resources:

- Dedicated input capture pin
- 16-bit HRCAP clock which is either equal to the PLL2 output frequency (asynchronous to SYSCLK2) or equal to the SYSCLK2 frequency (synchronous to SYSCLK2)
- High-resolution pulse width capture in a 2-deep buffer

Figure 6-52. HRCAP Functional Block Diagram

Table 6-65. HRCAP Registers

NAME	HRCAP1	HRCAP2	HRCAP3	HRCAP4	SIZE (x16)	DESCRIPTION
HCCTL	0x6AC0	0x6AE0	0x6C80	0x6CA0	1	HRCAP Control Register ⁽¹⁾

HCICLR	0x6AC2	0x6AE2	0x6C82	0x6CA2	1	HRCAP Interrupt Clear Register ⁽¹⁾
HCIFRC	0x6AC3	0x6AE3	0x6C83	0x6CA3	1	HRCAP Interrupt Force Register ⁽¹⁾
HCCOUNTER	0x6AC4	0x6AE4	0x6C84	0x6CA4	1	HRCAP 16-bit Counter Register
HCCAPCNTRISE0	0x6AD0	0x6AF0	0x6C90	0x6CB0	1	HRCAP Capture Counter on Rising Edge 0 Register
HCCAPCNTFALL0	0x6AD2	0x6AF2	0x6C92	0x6CB2	1	HRCAP Capture Counter on Falling Edge 0 Register
HCCAPCNTRISE1	0x6AD8	0x6AF8	0x6C98	0x6CB8	1	HRCAP Capture Counter on Rising Edge 1 Register
HCCAPCNTFALL1	0x6ADA	0x6AFA	0x6C9A	0x6CBA	1	HRCAP Capture Counter on Falling Edge 1 Register

(1) Registers that are EALLOW-protected.

6.9.12.1 HRCAP Electrical Data/Timing

Table 6-66. High-Resolution Capture (HRCAP) Timing Requirements

		MIN	NOM	MAX	UNIT
$t_{c(HCCAPCLK)}$	Cycle time, HRCAP capture clock	8.333		10.204	ns
$t_{w(HRCAP)}$	Pulse width, HRCAP capture	$7t_{c(HCCAPCLK)}$ ⁽¹⁾			ns
	HRCAP step size ⁽²⁾		300		ps

- (1) The listed minimum pulse width does not take into account the limitation that all relevant HCCAP registers must be read and RISE/FALL event flags cleared within the pulse width to ensure valid capture data.
- (2) HRCAP step size will increase with low voltage and high temperature and decrease with high voltage and low temperature. Applications that use the HRCAP in high-resolution mode should use the HRCAP calibration functions to dynamically calibrate for varying operating conditions.

6.9.13 Enhanced Quadrature Encoder Modules (eQEP1, eQEP2)

The device contains up to two enhanced quadrature encoder (eQEP) modules. [Table 6-67](#) provides a summary of the eQEP registers.

Table 6-67. eQEP Control and Status Registers

NAME	eQEP1 ADDRESS	eQEP2 ADDRESS	eQEP1 SIZE(×16)/ #SHADOW	REGISTER DESCRIPTION

Figure 6-53 shows the block diagram of the eQEP module.

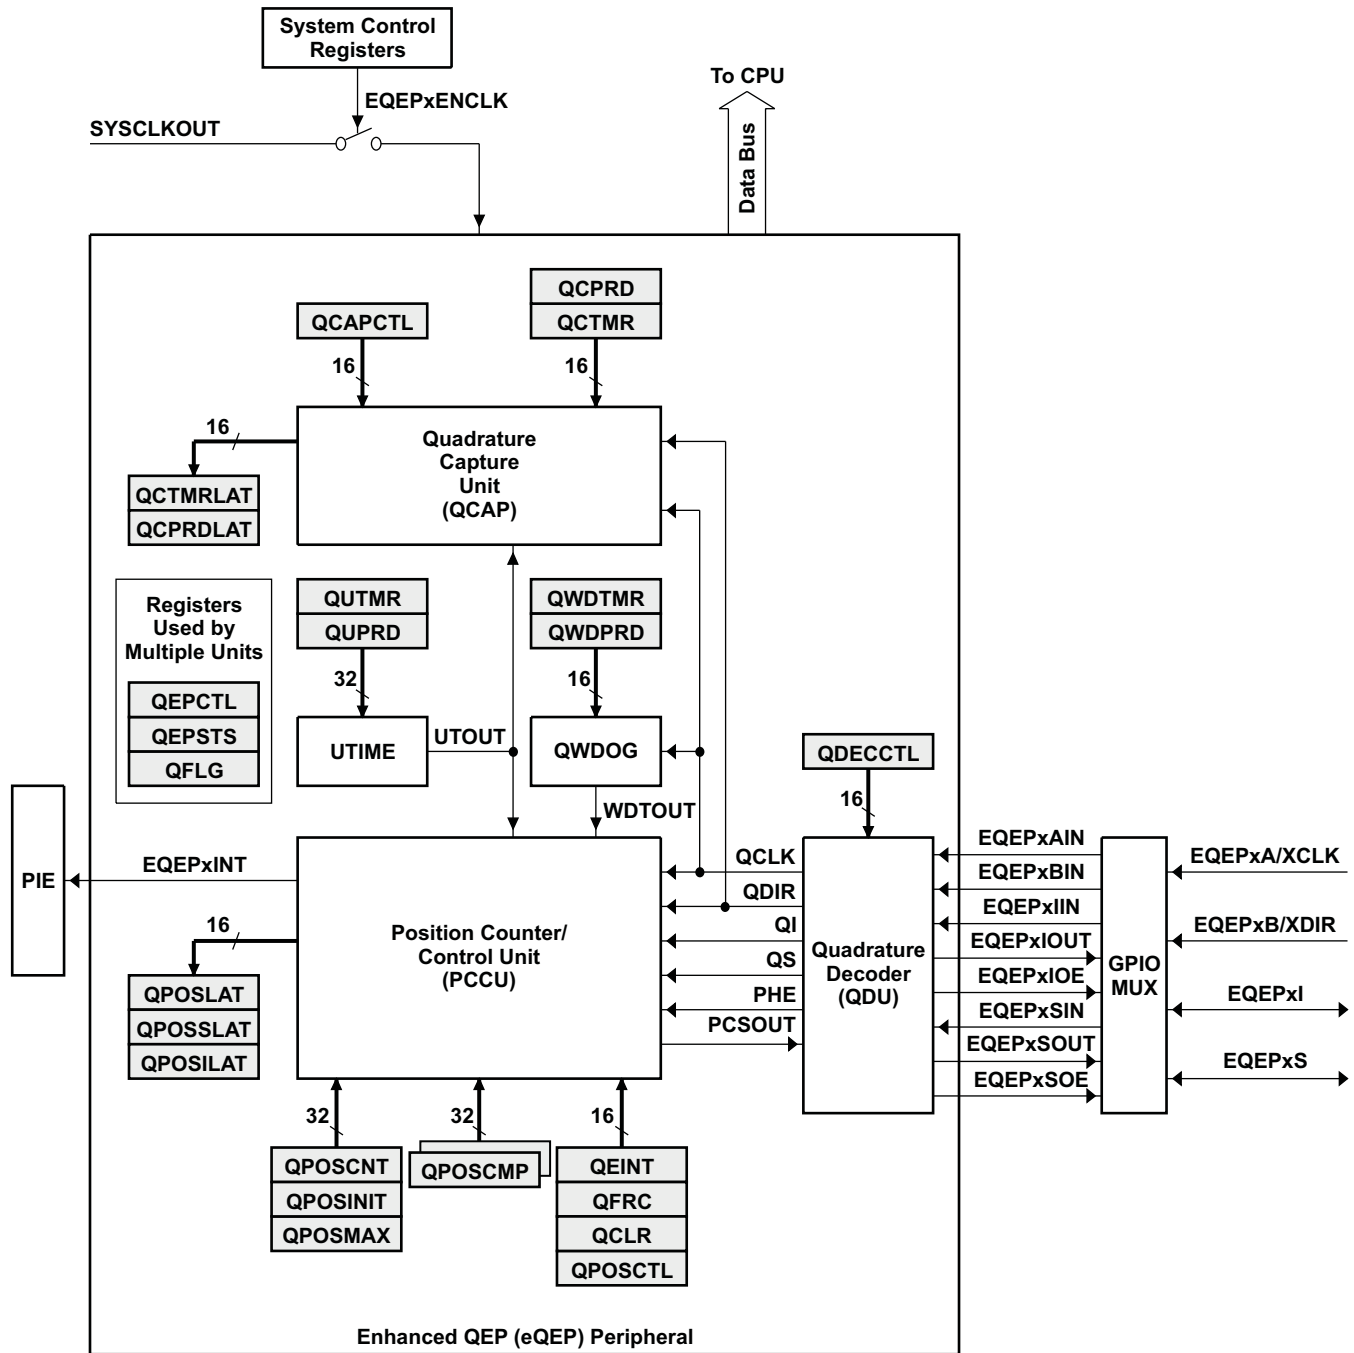

Figure 6-53. eQEP Functional Block Diagram

6.9.13.1 eQEP Electrical Data/Timing

Table 6-68 shows the eQEP timing requirement and Table 6-69 shows the eQEP switching characteristics.

Table 6-68. Enhanced Quadrature Encoder Pulse (eQEP) Timing Requirements⁽¹⁾

			MIN	MAX	UNIT
$t_{w(QEPP)}$	QEP input period	Asynchronous ⁽²⁾ /Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$2[1t_{c(SCO)} + t_{w(IQSW)}]$		
$t_{w(INDEXH)}$	QEP Index Input High time	Asynchronous ⁽²⁾ /Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$2t_{c(SCO)} + t_{w(IQSW)}$		
$t_{w(INDEXL)}$	QEP Index Input Low time	Asynchronous ⁽²⁾ /Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$2t_{c(SCO)} + t_{w(IQSW)}$		
$t_{w(STROBH)}$	QEP Strobe High time	Asynchronous ⁽²⁾ /Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$2t_{c(SCO)} + t_{w(IQSW)}$		
$t_{w(STROBL)}$	QEP Strobe Input Low time	Asynchronous ⁽²⁾ /Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$2t_{c(SCO)} + t_{w(IQSW)}$		

(1) For an explanation of the input qualifier parameters, see Table 6-76.

(2) Refer to the TMS320F28069, TMS320F28068, TMS320F28067, TMS320F28066, TMS320F28065, TMS320F28064, TMS320F28063, TMS320F28062 *Piccolo MCUs Silicon Errata (SPRZ342)* for limitations in the asynchronous mode.

Table 6-69. eQEP Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
$t_{d(CNTR)xin}$	Delay time, external clock to counter increment		$4t_{c(SCO)}$	cycles
$t_{d(PCS-OUT)QEP}$	Delay time, QEP input edge to position compare sync output		$6t_{c(SCO)}$	cycles

6.9.14 JTAG Port

On the 2806x device, the JTAG port is reduced to 5 pins ($\overline{\text{TRST}}$, TCK, TDI, TMS, TDO). TCK, TDI, TMS and TDO pins are also GPIO pins. The $\overline{\text{TRST}}$ signal selects either JTAG or GPIO operating mode for the pins in Figure 6-54. During emulation/debug, the GPIO function of these pins are not available. If the GPIO38/TCK/XCLKIN pin is used to provide an external clock, an alternate clock source should be used to clock the device during emulation/debug because this pin will be needed for the TCK function.

NOTE

In 2806x devices, the JTAG pins may also be used as GPIO pins. Care should be taken in the board design to ensure that the circuitry connected to these pins do not affect the emulation capabilities of the JTAG pin function. Any circuitry connected to these pins should not prevent the emulator from driving (or being driven by) the JTAG pins for successful debug.

Figure 6-54. JTAG/GPIO Multiplexing

6.9.15 General-Purpose Input/Output (GPIO) MUX

The GPIO MUX can multiplex up to three independent peripheral signals on a single GPIO pin in addition to providing individual pin bit-banging I/O capability.

The device supports 45 GPIO pins. The GPIO control and data registers are mapped to Peripheral Frame 1 to enable 32-bit operations on the registers (along with 16-bit operations). Table 6-70 shows the GPIO register mapping.

Table 6-70. GPIO Registers

(1) I = Input, O = Output

The user can select the type of input qualification for each GPIO pin through the GPxQSEL1/2 registers from four choices:

- Synchronization To SYSCLKOUT Only (GPxQSEL1/2 = 0, 0): This is the default mode of all GPIO pins at reset and it simply synchronizes the input signal to the system clock (SYSCLKOUT).
- Qualification Using Sampling Window (GPxQSEL1/2 = 0, 1 and 1, 0): In this mode the input signal, after synchronization to the system clock (SYSCLKOUT), is qualified by a specified number of cycles before the input is allowed to change.
- The sampling period is specified by the QUALPRD bits in the GPxCTRL register and is configurable in groups of 8 signals. The sampling period specifies a multiple of SYSCLKOUT cycles for sampling the input signal. The sampling window is either 3-samples or 6-samples wide and the output is only changed when ALL samples are the same (all 0s or all 1s) as shown in Figure 4-18 (for 6 sample mode).
- No Synchronization (GPxQSEL1/2 = 1,1): This mode is used for peripherals where synchronization is not required (synchronization is performed within the peripheral).

Due to the multilevel multiplexing that is required on the device, there may be cases where a peripheral input signal can be mapped to more than one GPIO pin. Also, when an input signal is not selected, the input signal will default to either a 0 or 1 state, depending on the peripheral.

- A. x stands for the port, either A or B. For example, GPxDIR refers to either the GPADIR and GPBDIR register depending on the particular GPIO pin selected.
- B. GPxDAT latch/read are accessed at the same memory location.
- C. This is a generic GPIO MUX block diagram. Not all options may be applicable for all GPIO pins. See the Systems Control and Interrupts chapter of the *TMS320x2806x Piccolo Technical Reference Manual (SPRUH18)* for pin-specific variations.

Figure 6-55. GPIO Multiplexing

6.9.15.1 GPIO Electrical Data/Timing

6.9.15.1.1 GPIO Output Timing

Table 6-75. General-Purpose Output Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER			MIN	MAX	UNIT
$t_{r(GPO)}$	Rise time, GPIO switching low to high	All GPIOs		13 ⁽¹⁾	ns
$t_{f(GPO)}$	Fall time, GPIO switching high to low	All GPIOs		13 ⁽¹⁾	ns
f_{GPO}	Toggling frequency			22.5	MHz

(1) Rise time and fall time vary with electrical loading on I/O pins. Values given in Table 6-75 are applicable for a 40-pF load on I/O pins.

Figure 6-56. General-Purpose Output Timing

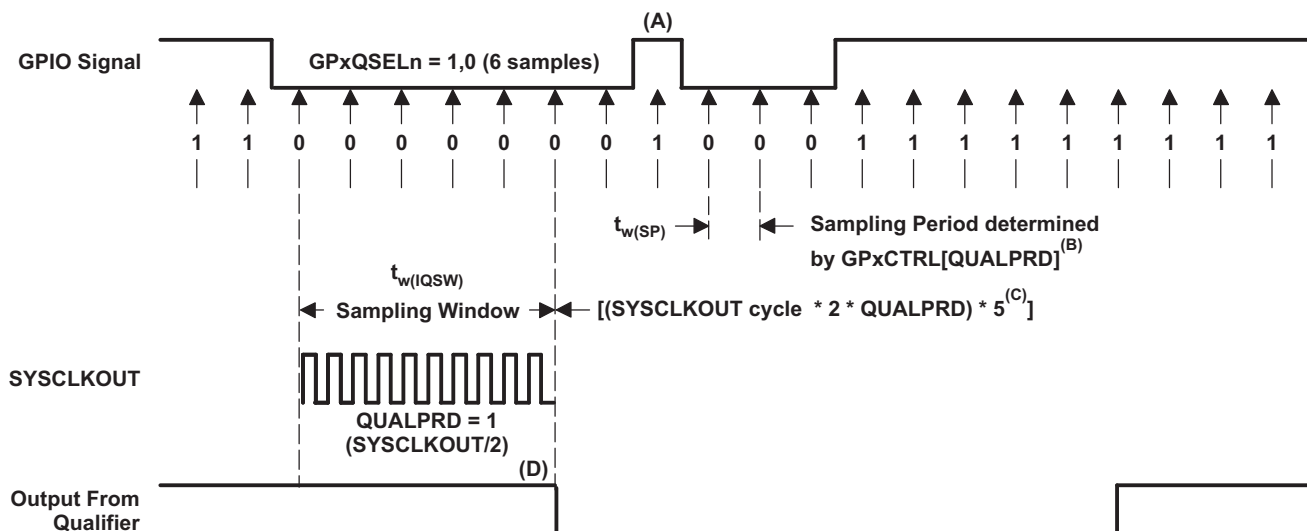

6.9.15.1.2 GPIO Input Timing

Table 6-76. General-Purpose Input Timing Requirements

			MIN	MAX	UNIT
$t_{w(SP)}$	Sampling period	QUALPRD = 0	$1t_{c(SCO)}$		cycles
		QUALPRD \neq 0	$2t_{c(SCO)} * QUALPRD$		
$t_{w(IQSW)}$	Input qualifier sampling window		$t_{w(SP)} * (n^{(1)} - 1)$		cycles
$t_{w(GPI)}^{(2)}$	Pulse duration, GPIO low/high	Synchronous mode	$2t_{c(SCO)}$		cycles
		With input qualifier	$t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$		

(1) "n" represents the number of qualification samples as defined by GPxQSELn register.

(2) For $t_{w(GPI)}$, pulse width is measured from V_{IL} to V_{IL} for an active-low signal and V_{IH} to V_{IH} for an active-high signal.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. The QUALPRD bit field value can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is one SYSCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYSCLKOUT cycles (that is, at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected through the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Because external signals are driven asynchronously, a 13-SYSCLKOUT-wide pulse ensures reliable recognition.

Figure 6-57. Sampling Mode

6.9.15.1.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = $\text{SYSCLKOUT} / (2 * \text{QUALPRD})$, if $\text{QUALPRD} \neq 0$

Sampling frequency = SYSCLKOUT , if $\text{QUALPRD} = 0$

Sampling period = $\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}$, if $\text{QUALPRD} \neq 0$

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle , if $\text{QUALPRD} = 0$

In a given sampling window, either three or six samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

Case 1:

Qualification using three samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 2$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 2$, if $\text{QUALPRD} = 0$

Case 2:

Qualification using six samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 5$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 5$, if $\text{QUALPRD} = 0$

Figure 6-58. General-Purpose Input Timing

Figure 6-59. Input Resistance Model for a GPIO Pin With an Internal Pullup

6.9.15.1.4 Low-Power Mode Wakeup Timing

Table 6-77 shows the timing requirements, Table 6-78 shows the switching characteristics, and Figure 6-60 shows the timing diagram for IDLE mode.

Table 6-77. IDLE Mode Timing Requirements⁽¹⁾

		MIN	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualifier	$2t_{c(SCO)}$	cycles
		With input qualifier	$5t_{c(SCO)} + t_{w(IQSW)}$	

(1) For an explanation of the input qualifier parameters, see Table 6-76.

Table 6-78. IDLE Mode Switching Characteristics⁽¹⁾

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{d(WAKE-IDLE)}$	Delay time, external wake signal to program execution resume ⁽²⁾				cycles
	• Wake-up from flash – Flash module in active state	Without input qualifier		$20t_{c(SCO)}$	cycles
		With input qualifier		$20t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake-up from flash – Flash module in sleep state	Without input qualifier		$1050t_{c(SCO)}$	cycles
		With input qualifier		$1050t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake-up from SARAM	Without input qualifier		$20t_{c(SCO)}$	cycles
With input qualifier			$20t_{c(SCO)} + t_{w(IQSW)}$		

(1) For an explanation of the input qualifier parameters, see Table 6-76.

(2) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake-up) signal involves additional latency.

- A. WAKE INT can be any enabled interrupt, \overline{WDINT} or \overline{XRS} . After the IDLE instruction is executed, a delay of five OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- B. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least four OSCCLK cycles have elapsed.

Figure 6-60. IDLE Entry and Exit Timing

Table 6-79. STANDBY Mode Timing Requirements

			MIN	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualification	$3t_{c(OSCCLK)}$		cycles
		With input qualification ⁽¹⁾	$(2 + QUALSTDBY) * t_{c(OSCCLK)}$		

(1) QUALSTDBY is a 6-bit field in the LPMCR0 register.

Table 6-80. STANDBY Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{d(IDLE-XCOL)}$	Delay time, IDLE instruction executed to XCLKOUT low		$32t_{c(SCO)}$	$45t_{c(SCO)}$	cycles
$t_{d(WAKE-STBY)}$	Delay time, external wake signal to program execution resume ⁽¹⁾				cycles
	• Wake up from flash – Flash module in active state	Without input qualifier	$100t_{c(SCO)}$		cycles
		With input qualifier	$100t_{c(SCO)} + t_{w(WAKE-INT)}$		
	• Wake up from flash – Flash module in sleep state	Without input qualifier	$1125t_{c(SCO)}$		cycles
		With input qualifier	$1125t_{c(SCO)} + t_{w(WAKE-INT)}$		
	• Wake up from SARAM	Without input qualifier	$100t_{c(SCO)}$		cycles
With input qualifier		$100t_{c(SCO)} + t_{w(WAKE-INT)}$			

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
- B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for the number of cycles indicated below before being turned off:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
 This delay enables the CPU pipeline and any other pending operations to flush properly.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode. After the IDLE instruction is executed, a delay of five OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- D. The external wake-up signal is driven active.
- E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
- F. After a latency period, the STANDBY mode is exited.
- G. Normal execution resumes. The device will respond to the interrupt (if enabled).
- H. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least four OSCCLK cycles have elapsed.

Figure 6-61. STANDBY Entry and Exit Timing Diagram

Table 6-81. HALT Mode Timing Requirements

		MIN	MAX	UNIT
$t_w(\text{WAKE-GPIO})$	Pulse duration, GPIO wake-up signal	$t_{\text{oscst}} + 2t_c(\text{OSCCLK})$		cycles
$t_w(\text{WAKE-XRS})$	Pulse duration, $\overline{\text{XRS}}$ wakeup signal	$t_{\text{oscst}} + 8t_c(\text{OSCCLK})$		cycles

Table 6-82. HALT Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
$t_d(\text{IDLE-XCOL})$	Delay time, IDLE instruction executed to XCLKOUT low	$32t_c(\text{SCO})$	$45t_c(\text{SCO})$	cycles
t_p	PLL lock-up time		1	ms
$t_d(\text{WAKE-HALT})$	Delay time, PLL lock to program execution resume		$1125t_c(\text{SCO})$	cycles
	<ul style="list-style-type: none"> • Wake up from flash <ul style="list-style-type: none"> – Flash module in sleep state • Wake up from SARAM 			

- A. IDLE instruction is executed to put the device into HALT mode.
- B. The PLL block responds to the HALT signal. SYSCLKOUT is held for the number of cycles indicated below before oscillator is turned off and the CLKIN to the core is stopped:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
This delay enables the CPU pipeline and any other pending operations to flush properly.
- C. Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power. It is possible to keep the zero-pin internal oscillators (INTOSC1 and INTOSC2) and the watchdog alive in HALT mode. This is done by writing to the appropriate bits in the CLKCTL register. After the IDLE instruction is executed, a delay of five OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- D. When the GPIO pin (used to bring the device out of HALT) is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Because the falling edge of the GPIO pin asynchronously begins the wakeup procedure, care should be taken to maintain a low-noise environment before entering and during HALT mode.
- E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
- F. Once the oscillator has stabilized, the PLL lock sequence is initiated, which takes 1 ms.
- G. When CLKIN to the core is enabled, the device will respond to the interrupt (if enabled), after a latency. The HALT mode is now exited.
- H. Normal operation resumes.
- I. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least four OSCCLK cycles have elapsed.

7 Applications, Implementation, and Layout

NOTE

Information in the following sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

View the [Important Notice for TI Designs](#) covering authorized use, intellectual property matters and disclaimers.

7.1 TI Design or Reference Design

TI Designs Reference Design Library is a robust reference design library spanning analog, embedded processor and connectivity. Created by TI experts to help you jump start your system design, all TI Designs include schematic or block diagrams, BOMs and design files to speed your time to market. Search and download designs at ti.com/tidesigns.

7.1.1 Digitally Controlled Non-Isolated DC/DC Buck Converter Reference Design

[TIDM-DC-DC-BUCK](#) — This design implements a non-isolated DC/DC buck converter that is digitally controlled using a C2000 microcontroller. The main purpose of this design is to evaluate the powerSUITE Digital Power Software tools. The design consists of two separate boards: 1) Digital Power BoosterPack™ Plug-in Module and 2) C2000 F28069M LaunchPad™ Development Kit or C2000 F28377S LaunchPad Development Kit.

7.1.2 672W Highly Integrated Reference Design for Automotive Bidirectional 48V-12V Converter

[TIDA-00558](#) — Today's automotive power consumption is 3KW, which will increase to 10KW in the next 5 years. A 12-V battery is unable to provide that much power. The 48-12V bidirectional converter provides a high-power requirement solution with two phases, each capable of running 28 A. This solution allows bidirectional current control of both phases using a C2000 control stick and firmware OCP and OVP. The 48-12V bidirectional converter removes the voltage conditioner need and distributes loads more evenly. The 48-V battery is used to power high-torque motors and other high-power components, such as A/C compressors and EPS, with no change to 12-V battery loads.

7.1.3 System-on-Module for Power Line Communication Reference Design

[TIDM-SOMPLC-F28PLC84](#) — The SOMPLC-F28PLC84 is a single-board System-on-Module (SOM) for PLC in the CENELEC frequency band. This single hardware design supports several popular PLC industry standards, including PRIME, G3-PLC, and IEEE-1901.2. The SOMPLC-F28PLC84 replaces the earlier SOMPLC-F28PLC83 and is fully hardware- and software-compatible with the earlier design.

7.1.4 G3 Power Line Communications Data Concentrator on BeagleBone Black Platform

[TIDEP0023](#) — This Power Line Communications (PLC) Data Concentrator design offers a simplified approach for evaluating G3-PLC utilizing Beagle Bone Black powered by the AM335x Sitara™ processor. Users can establish a G3-PLC network with one service node. Single-phase coupling is supported.

7.1.5 Texas Instruments' Power Line Communication Developer's Kit - V3

[TIDM-TMDSPLCKIT-V3](#) — The TI PLC Developer's Kit is the best way to evaluate TI's PLC technology for use in industrial applications such as Smart Grid AMI networks and solar inverters. Due to TI's flexible PLC architecture, this one kit can be used for evaluating several different PLC standards (PRIME, G3, PLC Lite), allowing developers to choose the PLC technology that best fits their application. This developer's kit enables users to perform PLC tests on live power networks quickly while making it easier to write their own application software.

7.1.6 DC Power Line Communication (PLC) Reference Design

[TIDA-00067](#) — The DC (24 V, nominal) Power-Line Communication (PLC) reference design is intended as an evaluation module that customers can use to develop end-products for industrial applications, leveraging the capability to deliver both power and communications over the same DC power line. The reference design provides a complete design guide for the hardware and firmware design of a master (PLC) node, slave (PLC) node in an extremely small (approximately 1-inch diameter) industrial form factor.

7.2 Development Tools

7.2.1 F28069 Piccolo controlCARD

[TMDSNCND28069](#) — The C2000 controlCARDS from Texas Instruments are ideal products for OEMs to use for initial software development and short-run builds for system prototypes, test stands, and many other projects that require easy access to high-performance controllers. The controlCARDS are complete board-level modules that utilize an industry-standard DIMM form factor to provide a low-profile, single-board controller solution. All of the C2000 controlCARDS use the same 100-pin connector footprint to provide the analog and digital I/Os on-board controller and are completely interchangeable. The host system needs to provide only a single 5-V power rail to the controlCARD for it to be fully functional.

7.2.2 F28069 Piccolo controlSTICK

[TMDS28069USB](#) — The innovative Piccolo controlSTICK allows quick and easy evaluation all of the advanced capabilities of TI's Piccolo microcontroller. Slightly larger than a memory stick, the Piccolo controlSTICK features on-board JTAG emulation and access to all control peripherals. Example projects walk the user through the advanced functionality of Piccolo, from simply blinking an LED to configuring the high resolution ePWM peripherals.

7.2.3 F28069 Piccolo Experimenter Kit

[TMDSDOCK28069](#) — The C2000 experimenter kits from Texas Instruments are ideal products for OEMs to use for initial device exploration and testing. The Piccolo F28069 Experimenter Kit has a docking station that features on-board USB JTAG emulation, access to all controlCARD signals, breadboard areas and RS-232 and JTAG connectors. Each kit contains a F28069 controlCARD. The controlCARD is a complete board-level module that utilizes an industry-standard DIMM form factor to provide a low-profile, single-board controller solution. The kit is complete with Code Composer Studio IDE and USB cable.

7.3 Software Tools

7.3.1 controlSUITE Software Suite

[CONTROLSUITE](#) — controlSUITE™ for C2000 microcontrollers is a cohesive set of software infrastructure and software tools designed to minimize software development time.

7.3.2 Code Composer Studio (CCS) Integrated Development Environment (IDE)

[CCSTUDIO](#) — Code Composer Studio is an integrated development environment (IDE) that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

7.3.3 Pin Mux Tool

[PINMUXTOOL](#) — The Pin Mux Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI MPUs.

7.4 Training

7.4.1 *InstaSPIN-FOC LaunchPad and BoosterPack*

This six-part series provides information about the C2000 InstaSPIN-FOC Motor Control LaunchPad Development Kit and BoosterPack Plug-in Module.

The InstaSPIN-FOC enabled C2000 Piccolo LaunchPad is an inexpensive evaluation platform designed to help you leap right into the world of sensorless motor control using the InstaSPIN-FOC solution.

[Part 1: Introduction and Overview](#)

[Part 2: Identifying Your Motor](#)

[Part 3: Zero Speed, Low Speed, & Tuning](#)

7.4.2 *C2000 Architecture and Peripherals*

[C2000 Architecture and Peripherals](#) — The C2000 family of microcontrollers contains a unique mix of innovative and cutting-edge peripherals along with a very capable C28x core. This video goes over the core architecture and every peripheral offered on C2000 devices.

7.4.3 *Piccolo Control Law Accelerator (CLA) Technical Overview*

[Piccolo Control Law Accelerator \(CLA\) Technical Overview](#) — This technical overview of the C2000 Piccolo TMS320F2803x Control Law Accelerator (CLA) that describes how the independent, 32-bit floating-point math accelerator runs in parallel with the C28x core.

8 Device and Documentation Support

8.1 Device Support

8.1.1 Development Support

Texas Instruments (TI) offers an extensive line of development tools for the C28x generation of MCUs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of 2806x-based applications:

Software Development Tools

- Code Composer Studio™ Integrated Development Environment (IDE)
 - C/C++ Compiler
 - Code generation tools
 - Assembler/Linker
 - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

Hardware Development Tools

- Development and evaluation boards
- JTAG-based emulators - XDS510™ class, XDS560™ emulator, XDS100
- Flash programming tools
- Power supply
- Documentation and cables

8.1.1.1 Getting Started

Key links include:

1. [Getting Started with C2000 Real-time Control MCUs](#)
2. [Motor Drive & Control](#)
3. [Digital Power](#)
4. [Tools & Software for Performance MCUs](#)

8.1.2 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ MCU devices and support tools. Each TMS320 MCU commercial family member has one of three prefixes: TMX, TMP, or TMS (for example, **TMS**320F28069). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (with TMX for devices and TMDX for tools) through fully qualified production devices/tools (with TMS for devices and TMDS for tools).

Device development evolutionary flow:

TMX	Experimental device that is not necessarily representative of the final device's electrical specifications
TMP	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
TMS	Fully qualified production device

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing

TMDS Fully qualified development-support product

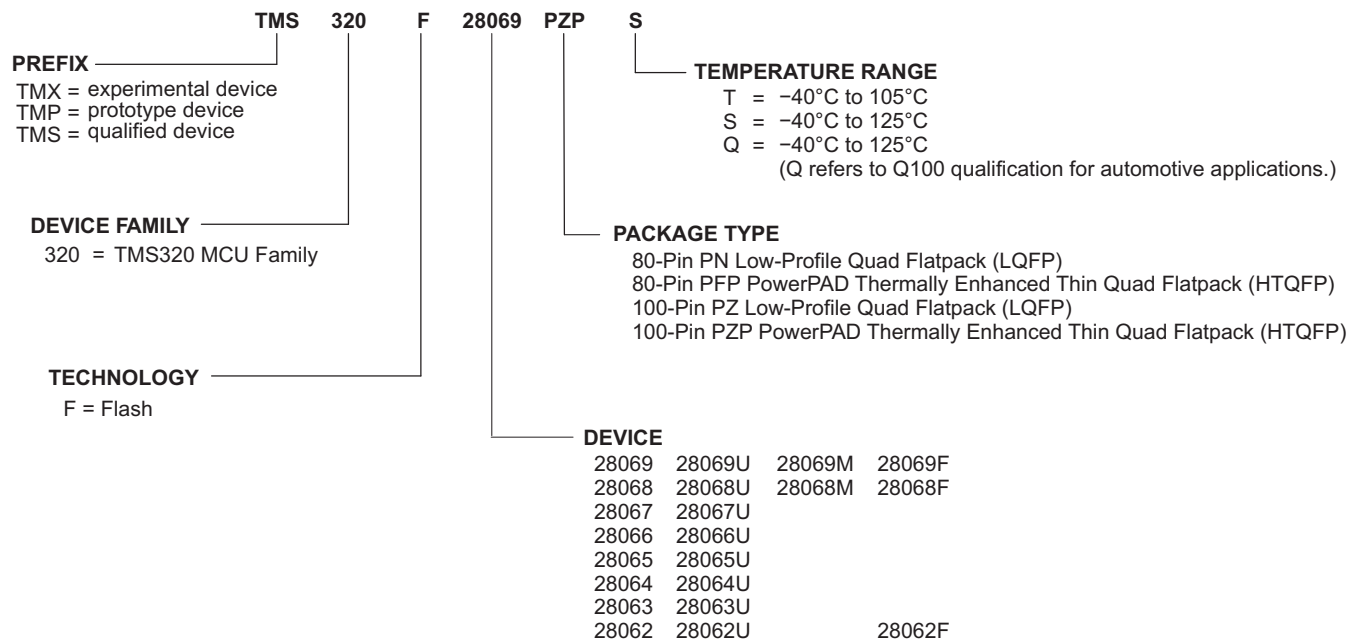

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PZP) and temperature range (for example, S). [Figure 8-1](#) provides a legend for reading the complete device name for any family member.

A. For more information on peripheral, temperature, and package availability for a specific device, see [Table 3-1](#).

Figure 8-1. Device Nomenclature

8.2 Documentation Support

Extensive documentation supports all of the TMS320 MCU family generations of devices from product announcement through applications development. The types of documentation available include: data sheets and data manuals, with design specifications; and hardware and software applications.

See the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* ([SPRU566](#)) for more information on types of peripherals. See the *TMS320x2806x Piccolo Technical Reference Manual* ([SPRUH18](#)) for more information about each peripheral.

The following documents can be downloaded from the TI website (www.ti.com):

Data Manual and Errata

SPRS698 **TMS320F2806x Piccolo™ Microcontrollers Data Manual** contains the pinout, signal descriptions, as well as electrical and timing specifications for the 2806x devices.

SPRZ342 **TMS320F28069, TMS320F28068, TMS320F28067, TMS320F28066, TMS320F28065, TMS320F28064, TMS320F28063, TMS320F28062 Piccolo MCUs Silicon Errata** describes known advisories on silicon and provides workarounds.

InstaSPIN Technical Reference Manuals

SPRUHJ1 **InstaSPIN-FOC™ and InstaSPIN-MOTION™ User's Guide** describes the InstaSPIN-FOC and InstaSPIN-MOTION devices.

SPRUHI9 **TMS320F28069F, TMS320F28068F, TMS320F28062F InstaSPIN-FOC™ Software Technical Reference Manual** describes the TMS320F28069F, TMS320F28068F, and TMS320F28062F InstaSPIN-FOC™ software.

SPRUHJ0 **TMS320F28069M, TMS320F28068M InstaSPIN-MOTION™ Software Technical Reference Manual** describes the TMS320F28069M and TMS320F28068M InstaSPIN-MOTION™ software.

CPU User's Guides

SPRU430 **TMS320C28x CPU and Instruction Set Reference Guide** describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). This reference guide also describes emulation features available on these DSPs.

Peripheral Guides and Technical Reference Manuals

SPRU566 **TMS320x28xx, 28xxx DSP Peripheral Reference Guide** describes the peripheral reference guides of the 28x digital signal processors (DSPs).

SPRUH18 **TMS320x2806x Piccolo Technical Reference Manual** details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

Tools Guides

SPRU513 **TMS320C28x Assembly Language Tools v15.12.0.LTS User's Guide** describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

SPRU514 **TMS320C28x Optimizing C/C++ Compiler v15.12.0.LTS User's Guide** describes the TMS320C28x C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

SPRU608 **TMS320C28x Instruction Set Simulator Technical Overview** describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x core.

Application Reports

SZZA021 **Semiconductor Packing Methodology** describes the packing methodologies employed to prepare semiconductor devices for shipment to end users.

SPRABX4 **Calculating Useful Lifetimes of Embedded Processors** provides a methodology for calculating the useful lifetime of TI embedded processors (EPs) under power when used in electronic systems. It is aimed at general engineers who wish to determine if the reliability of the TI EP meets the end system reliability requirement.

8.2.1 Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com. In the upper right-hand corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

8.3 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

8.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

TI Embedded Processors Wiki *Texas Instruments Embedded Processors Wiki*. Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

8.5 Trademarks

PowerPAD, Piccolo, TMS320C2000, C2000, controlSUITE, BoosterPack, LaunchPad, Sitara, Code Composer Studio, XDS510, XDS560, TMS320, InstaSPIN-FOC, InstaSPIN-MOTION, E2E are trademarks of Texas Instruments.

I²C-bus is a registered trademark of NXP B.V. Corporation.

All other trademarks are the property of their respective owners.

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

9 Mechanical Packaging and Orderable Information

9.1 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

THERMAL PAD MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

LAND PATTERN DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-SM-7351 is recommended for alternate designs.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
